**Appendix 2** – Groundwater Quality Data Statistical Analyses

**Appendix 3** – Alternative Source Demonstrations

**Appendix 4** – Notices for Monitoring Program Transitions - NA

**Appendix 5** – Well Installation / Decommissioning Logs – NA

**Abbreviations:**

ASD – Alternate Source Demonstration

CCR – Coal Combustion Residual

GWPS – Groundwater Protection Standard

SSI – Statistically Significant Increase

SSL – Statistically Significant Level

MTBAP – Mountaineer Bottom Ash Pond

## **I. Overview**

This *Annual Groundwater Monitoring and Corrective Action Report* (Report) has been prepared to report the status of activities for the preceding year for the bottom ash pond CCR unit at Appalachian Power Company's, a wholly-owned subsidiary of American Electric Power Company (AEP), Mountaineer Power Plant. The USEPA's CCR rules require that the Annual Groundwater Monitoring and Corrective Action Report be posted to the operating record for the preceding year no later than January 31.

In general, the following activities were completed:

- An assessment monitoring program for Mountaineer Bottom Ash Pond (MT BAP) was established on April 13, 2018.
- Statistically significant level (SSL) of lithium concentrations above groundwater protection standards (GWPSs) were observed on January 8, 2019. An Assessment of Corrective Measures (ACM) was initiated on March 26, 2019. The ACM was completed on June 24, 2019 and the public meeting to discuss the proposed remedies was held on August 22, 2019. The ACM was revised on November 30, 2020 per federal EPA comments received via conference call discussions.
- The BAP selected a final design and remedy for the groundwater corrective action on December 22, 2021. The BAP established and implemented the Corrective Action Monitoring Plan (CAMP) within 90 days of selecting a remedy.
- Ash and impacted soil removal activities as outlined in the most recent closure plan were completed in 2023.
- Mountaineer BAP started 2023 in corrective measures. The BAP ended the year in the corrective action program.
- Groundwater samples were collected in March, May, and October 2023 and analyzed for all Appendix III and Appendix IV constituents, as specified in the CAMP and AEP's *Groundwater Sampling and Analysis Plan (2016)*.
- Analytical results for groundwater monitoring data received during this reporting period are summarized in **Appendix 1** along with groundwater flow rates and direction.
- Groundwater data underwent various validation tests, including tests for completeness, valid values, transcription errors, and consistent units.
- The November 2022 sampling event statistical analysis was completed in March 2023 and is included in **Appendix 2**. The statistical analysis identified the following:
  - Under Corrective Measures Monitoring: the upper confidence level (UCL) for Lithium exceeded the GWPS at the certified monitoring well network wells: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S; and in

the nature and extent wells: MW-1921, MW-1922S, MW-1923, MW-1924, and MW-1925.

- SSL for Arsenic, where the Lower Confidence Limit (LCL) exceeded the GWPS, was noted at primary nature and extent wells MW-1805 and MW-1922D.
- SSL for Molybdenum was noted at secondary nature and extent well MW-1921.
- Statistically Significant Increase (SSI) for Boron above the upper prediction limit (UPL) was observed at MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
- SSI for Calcium above the UPL was observed at MW-1604S, MW-1605D, and MW-1607D.
- SSI for Chloride above the UPL was observed at MW-1604S, MW-1604D, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
- SSI for Fluoride above the UPL was observed at MW-1606S and MW-1607D.
- SSI for Sulfate above the UPL was observed at MW-1604S, MW-1605D, MW-1606D, and MW-1607D.
- SSI for TDS above the UPL was observed at MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
- Notification of constituent(s) above GWPS was completed.
- The statistical analysis for the May 2023 corrective action monitoring event was completed in September 2023 and is included in **Appendix 2**. The statistical analysis identified the following:
  - Under Corrective Measures Monitoring: the UCL for Lithium exceeded the GWPS at the certified monitoring well network wells: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S; and in the nature and extent wells: MW-1922S, MW-1923, MW-1924, and MW-1925.
  - SSL for Arsenic was noted at the primary nature and extent wells MW-1805 and MW-1922D.
  - SSI for Boron above the UPL was observed at MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
  - SSI for Calcium above the UPL was observed at MW-1604S.
  - SSI for Chloride above the UPL was observed at MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
  - SSI for Fluoride above the UPL was observed at MW-1606S and MW-1607D.

- SSI for Sulfate above the UPL was observed at MW-1604S, MW-1605D, MW-1605S, MW-1606D, and MW-1607D.
  - SSI for TDS above the UPL was observed at MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
- Notification of constituent(s) for potential SSL was completed.
- Alternate source demonstrations (ASDs) were completed for the potential SSLs not included in the corrective measures and are included in **Appendix 3**.
- The October 2023 sampling event data are still undergoing statistical analysis.

The major components of this annual report, to the extent applicable at this time, are presented in sections that follow:

- A map, aerial photograph or a drawing showing the CCR management unit(s), all groundwater monitoring wells and monitoring well identification numbers.
- Identification of any monitoring wells that were installed or decommissioned during the preceding year, along with a statement as to why that happened.
- All the monitoring data collected, including the rate and direction of groundwater flow, plus a summary showing the number of samples collected per monitoring well, the dates the samples were collected and whether the sample was collected as part of detection monitoring or assessment monitoring programs (Attached as **Appendix 1**).
- Statistical comparison of monitoring data to determine if there have been SSI's or SSL's (Attached as **Appendix 2**, where applicable).
- A discussion of whether any alternate source demonstrations were performed, and the conclusions (Attached as **Appendix 3**).
- A summary of any transition between monitoring programs or an alternate monitoring frequency, for example the date and circumstances for transitioning from detection monitoring to assessment monitoring, in addition to identifying the constituents detected at a statistically significant increase over background concentrations (**Appendix 4**).
- Identification of any monitoring wells that were installed or decommissioned during the preceding year, along with a statement as to why that happened (Attached as Appendix 5, where applicable). This is not applicable.
- Corrective Action evaluation and other information required to be included in the annual report, if applicable.

In addition, this report summarizes key actions completed, and where applicable, describes any problems encountered and actions taken to resolve those problems. The report includes a projection of key activities for the upcoming year.

## **II. Groundwater Monitoring Well Locations and Identification Numbers**

**Figure 1** that follows depicts the PE-certified groundwater monitoring network, the monitoring well locations, and their corresponding identification numbers. The total groundwater monitoring network includes 4 background wells and 8 down-gradient wells. The monitoring well distribution adequately cover down-gradient and background areas as detailed in the *Ground Water Monitoring Well Network Evaluation* report that was placed in the AEP CCR public internet site on March 9, 2017. Additional wells are shown in the figure that were installed as part of the Nature and Extent Characterization study.

### **III. Monitoring Wells Installed or Decommissioned**

No monitoring wells were installed or decommissioned in 2023.

### **IV. Groundwater Quality Data and Static Water Elevation Data and Flow Rate**

**Appendix 1** contains tables showing the groundwater quality data collected during the establishment of background quality, detection monitoring, assessment monitoring, and corrective action monitoring. Static water elevation data from each monitoring event also are shown in **Appendix 1**, along with the groundwater velocity calculations, groundwater flow direction and potentiometric maps developed after each sampling event. It is important to note that MW-1928 although installed, was unable to be sampled due to very low groundwater yield the first attempt and the monitoring well being dry and not recovering on the following attempts. Additionally, MW-112 also has low recovery and was not sampled during 2023.

### **V. Groundwater Quality Data Statistical Analysis**

- Statistical analysis of the November 2022, 257.95(d)(1) sampling event resulted in a SSL above the GWPS for arsenic, lithium and molybdenum in March 2023. A notice of this SSL was placed in the facility electronic operating record and on the publicly available internet site. The full statistical analysis report for this event is included in **Appendix 2**. The statistical analysis identified the following:
  - Under Corrective Measures Monitoring: the upper confidence level (UCL) for Lithium exceeded the GWPS at the certified monitoring well network wells: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S; and in the nature and extent wells: MW-1921, MW-1922S, MW-1923, MW-1924, and MW-1925.
  - SSL for Arsenic, where the Lower Confidence Limit (LCL) exceeded the GWPS, was noted at primary nature and extent wells MW-1805 and MW-1922D.
  - SSL for Molybdenum, where the LCL exceeded the GWPS, was noted at secondary nature and extent well MW-1921.
  - Statistically Significant Increase (SSI) for Boron above the upper prediction limit (UPL) was observed at MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
  - SSI for Calcium above the UPL was observed at MW-1604S, MW-1605D, and MW-1607D.
  - SSI for Chloride above the UPL was observed at MW-1604S, MW-1604D, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
  - SSI for Fluoride above the UPL was observed at MW-1606S and MW-1607D.

- SSI for Sulfate above the UPL was observed at MW-1604S, MW-1605D, MW-1606D, and MW-1607D.
  - SSI for TDS above the UPL was observed at MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
- Groundwater sampling to address the requirements of 40 CFR 257.85(b) were conducted February 10, 2023
- Statistical analysis of the May 2023 corrective action (40 CFR 257.98(a)(1)) sampling was completed in September 2023 and resulted in a SSL above GWPS for arsenic and lithium. A notice of these SSLs was placed in the facility electronic operating record and on the publicly available internet site. The full statistical analysis report for this event is included in **Appendix 2**. The statistical analysis identified the following:
  - Under Corrective Measures Monitoring: the UCL for Lithium exceeded the GWPS at the certified monitoring well network wells: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S; and in the nature and extent wells: MW-1922S, MW-1923, MW-1924, and MW-1925.
  - SSL for Arsenic, where the LCL exceeded the GWPS, was noted at the primary nature and extent wells MW-1805 and MW-1922D.
  - SSI for Boron above the UPL was observed at MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
  - SSI for Calcium above the UPL was observed at MW-1604S.
  - SSI for Chloride above the UPL was observed at MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.
  - SSI for Fluoride above the UPL was observed at MW-1606S and MW-1607D.
  - SSI for Sulfate above the UPL was observed at MW-1604S, MW-1605D, MW-1605S, MW-1606D, and MW-1607D.
  - SSI for TDS above the UPL was observed at MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S.

**Appendix 2** also contains a memorandum that explains the reissuance of select analytical laboratory reports to correct laboratory equipment data quality assurance/quality control issues.

## **VI. Alternative Source Demonstrations**

Successful ASDs were completed for arsenic and molybdenum GWPS exceedances and are included in **Appendix 3**.

## **VII. Discussion About Transition Between Monitoring Requirements or Alternate Monitoring Frequency**

The Mountaineer Bottom Ash Pond CCR Unit transitioned from the Assessment Monitoring program to the Assessment of Corrective Measures program on March 26, 2019 due to the SSL above a GWPS for Lithium on January 8, 2019. An Assessment of Corrective Measures Report was completed on June 24, 2019. A public meeting was held on August 22, 2019 to present the assessment of corrective measure options. Two semi-annual reports describing the progress in selecting and designing the remedy were completed in March and September of 2020 and 2021. The selection of remedy was completed on December 22, 2021. The remedy was initiated within 90 days of selection. The corrective action monitoring program was established and implemented within 90 days of selecting the remedy. The notice for initiating assessment of corrective measures was posted on the publicly available internet site (4-25-2019). The selection of remedy report can also be found on the publicly available internet site.

Regarding defining an alternate monitoring frequency, the groundwater velocity and monitoring well production is high enough at this facility that no modification to the monitoring frequency is needed.

## **VIII. Corrective Action and Other Required Information**

SSLs of lithium above the groundwater protection standard (GWPS, 40 ug/L) in some of the compliance monitoring wells were observed on January 8, 2019. 40 CFR §257.96(a) requires that an owner or operator initiate an assessment of corrective measures to prevent further release, to remediate any releases, and to restore impacted areas to original conditions if any Appendix IV constituent has been detected at a SSL exceeding a GWPS. An Assessment of Corrective Measures (ACM) was initiated on March 26, 2019. The ACM was completed on June 24, 2019, and the public meeting to discuss the proposed remedies was held on August 22, 2019. The ACM was revised on November 30, 2020, per federal EPA comments received via conference call discussions.

As discussed in the ACM, the nature and extent of lithium contamination in groundwater relative to GWPS (40 ug/L) has been defined per the 40 CFR 257 requirements based on the site-specific hydrogeology. The presence of nearby surface water body as well as the unimpacted background monitoring wells provide the boundaries for the extent of the GWPS exceedance.

The selected final design and remedy for the groundwater corrective action was completed on December 22, 2021. The selected remedy was source removal (closure by removal) and utilization of a hydraulic containment system (HCS). The Corrective Action Monitoring Plan (CAMP) for the BAP was established and implemented the within 90 days of selecting a remedy.

**Source Removal and Disposal:**

Ash and impacted soil removal activities as outlined in the most recent closure plan were completed in 2023, eliminating future mass flux of lithium to groundwater.

**Hydraulic Containment System:**

The hydraulic control system (HCS) for the Site is designed to maintain hydraulic capture of impacted groundwater. The table below provides a summary of groundwater extracted during this reporting period.

<b>Extraction Well</b>	<b>Gallons of GW extracted in 2023</b>
Well #4	19,184,392
Well #5	57,900,000
Well#6	17,216,100
East Well	174,445,203
West Well	167,857,055

The potentiometric maps depict the hydraulic capture of potential contaminated groundwater. Note: The plant was in an outage during the May 2023 gauging and sampling event.

Graphs and trend analysis of the lithium concentration over time are presented within the statistical analyses' reports located in the appendix. Based on a review of the time series graphs, Certified monitoring well network wells pairs MWs 1605S/D and 1606S/D show decreasing trends for lithium while monitoring well pairs MWs-1607S/D appear to be stable.

**IX. Description of Any Problems Encountered and Actions Taken**

No significant problems were encountered. The low flow sampling effort went smoothly, and the schedule was met to support this annual groundwater report preparation.

**X. A Projection of Key Activities for the Upcoming Year**

Key activities for 2024 include:

- Continue the HCS remedy for groundwater corrective actions;
- Continue to implement the most recent corrective action monitoring program (CAMP);
- Respond to any new data received considering what the CCR rule requires; and
- Preparation of the next annual groundwater report.

**Monitoring Well Network**

- ✿ Compliance Sampling Location
- ◆ Background Sampling Location
- ◆ Nature and Extent Wells

**Notes**

- Monitoring well coordinates provided by AEP.
- Site features based on information available in Ash Pond System-CCR Groundwater Monitoring Well Network Evaluation (Arcadis, 2016) provided by AEP.

**Table 1. Groundwater Data Summary  
Mountaineer – Bottom Ash Pond**

*Geosyntec Consultants, Inc.*

Notes:

- -: Not analyzed

<: Non-detect value. Analytes which were not detected are shown as less than the method detection limit (MDL) followed by a 'U1' flag.

In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

B1: Analyte detected in method blank (MB) at or above the method criteria.

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit.

In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

L1: The associated laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) recovery was outside acceptance limits.

M1: The associated matrix spike (MS) or matrix spike duplicate (MSD) recovery was outside acceptance limits.

mg/L: milligrams per liter

P1: The precision between duplicate results was above acceptance limits.

P3: The precision on the matrix spike duplicate (MSD) was above acceptance limits.

pCi/L: picocuries per liter

S7: Sample did not achieve constant weight.

SU: standard unit

µg/L: micrograms per liter

## Memorandum

Date: January 16, 2024

To: Jill Parker-Witt (AEP)

Copies to: Brian Newton (AEP)

From: Allison Kreinberg (Geosyntec)

Subject: Evaluation of 2023 Reissued Analytical Laboratory Data for  
Mountaineer Plant's Bottom Ash Ponds

---

In accordance with United States Environmental Protection Agency (USEPA) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments (CCR Rule; Code of Federal Regulations Title 40, Part 257, Subpart D) groundwater sampling was completed in 2023 to support assessment monitoring at the Bottom Ash Ponds, an existing CCR unit at the Mountaineer Plant in New Haven, West Virginia. After the statistical evaluation was completed using data from the first semiannual assessment monitoring event,<sup>1</sup> select analytical laboratory reports were reissued to correct an inconsistent number of significant figures in electronic data deliverables and the published laboratory reports.

A review of the reissued analytical laboratory reports identified reported lithium results that had the number of significant figures changed (Table 1). The site-specific background value for lithium was not updated as part of the first semiannual assessment monitoring event; therefore, the lithium results at background locations were not used in the statistical evaluation before the reissued analytical laboratory reports were reviewed. Both the initial reported lithium value and the revised lithium value at nature and extent and sentinel locations were below the site-specific groundwater protection standard of 0.0400 milligrams per liter (mg/L), and statistically significant levels of lithium were not identified at these locations during the first semiannual assessment monitoring event.<sup>1</sup> Therefore, no changes to the statistical outcome of the first semiannual assessment monitoring event would occur.

The revised lithium values in the reissued laboratory analytical reports will be used in future reporting and statistical evaluations.

## SECTION 1 EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency's (USEPA's) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments (40 CFR 257 Subpart D, "CCR rule"), groundwater monitoring has been conducted at the Bottom Ash Pond (BAP), an existing CCR unit at the Mountaineer Power Plant located in New Haven, West Virginia. Recent groundwater monitoring results were compared to site-specific groundwater protection standards (GWPS) to identify potential exceedances and evaluate progress towards completion of the selected corrective action.

Based on detection monitoring conducted in 2017 and 2018, statistically significant increases (SSIs) over background were concluded for boron, calcium, chloride, total dissolved solids (TDS), and sulfate at the BAP. An alternative source was not identified at the time, so the BAP initiated assessment monitoring in April 2018. GWPS were set in accordance with 40 CFR 257.95(d)(2) and a statistical evaluation of the assessment monitoring data was conducted in January 2019. Statistically significant levels (SSLs) were observed for lithium (Geosyntec, 2019).

An alternative source was not identified, so the BAP initiated an assessment of corrective measures in accordance with 40 CFR 257.96. Source Removal and Hydraulic Containment was selected as the remedial approach for lithium exceedances at the BAP (Sanborn Head, 2021). Corrective action monitoring was initiated in 2022, with corrective action monitoring events conducted at the BAP in March 2022, May 2022, and November 2022 in accordance with 40 CFR 257.98(a)(1) and the Corrective Action Monitoring Plan (Sanborn Head, 2022). The results of the November 2022 corrective action monitoring event are documented in this report.

Groundwater data underwent several validation tests, including those for completeness, sample tracking accuracy, transcription errors, and consistent use of measurement units. No data quality issues were identified which would impact data usability.

The monitoring data were submitted to Groundwater Stats Consulting, LLC for statistical analysis. GWPSs were re-established for the Appendix IV parameters. Confidence intervals were calculated for Appendix IV parameters at the compliance, nature and extent, and sentinel wells to assess whether Appendix IV parameters were present at SSLs above the GWPS. SSLs were identified for arsenic, lithium, and molybdenum. Corrective action statistics identified concentrations of lithium above the GWPS. Thus, the unit will continue corrective action monitoring as required by 40 CFR 275.98(a)(1). Certification of the selected statistical methods by a qualified professional engineer is documented in Attachment A.

## SECTION 2 BOTTOM ASH POND EVALUATION

### 2.1 Data Validation & QA/QC

During the assessment monitoring program, one set of samples was collected for analysis from the upgradient and downgradient wells to meet the requirements of 257.95(d)(1) in November 2022. The samples from November 2022 were analyzed for all Appendix III and IV parameters. A summary of data collected during this assessment monitoring event may be found in Table 1.

Chemical analysis was completed by an analytical laboratory certified by the National Environmental Laboratory Accreditation Program (NELAP). Quality assurance and quality control (QA/QC) samples completed by the analytical laboratory included the use of laboratory reagent blanks (LRBs), continuing calibration verification (CCV) samples, and laboratory fortified blanks (LFBs).

The analytical data were imported into a Microsoft Access database, where checks were completed to assess the accuracy of sample location identification and analyte identification. Where necessary, unit conversions were applied to standardize reported units across all sampling events. Exported data files were created for use with the Sanitas™ v.9.6.35 statistics software. The export file was checked against the analytical data for transcription errors and completeness. No QA/QC issues were noted which would impact data usability.

### 2.2 Statistical Analysis

Statistical analyses for the BAP were conducted in accordance with the January 2021 *Statistical Analysis Plan* (Geosyntec, 2021). Time series plots and results for all completed statistical tests are provided in Attachment B.

The data obtained in November 2022 for the background and compliance wells was screened for potential outliers. No outliers were identified for the data collected from these monitoring locations.

#### 2.2.1 Establishment of GWPSs

A GWPS was established for each Appendix IV parameter in accordance with 40 CFR 257.95(h) and the *Statistical Analysis Plan* (Geosyntec, 2021). The established GWPS was determined to be the greater value of the background concentration and the maximum contaminant level (MCL) or risk-based level specified in 40 CFR 257.95(h)(2) for each Appendix IV parameter. To determine background concentrations, an upper tolerance limit (UTL) was calculated using pooled data from the background wells collected during the background monitoring and assessment monitoring events. Tolerance limits were calculated parametrically with 95% coverage and 95% confidence for arsenic, chromium, cobalt, combined radium, and molybdenum. Non-parametric tolerance limits were calculated for antimony, barium, cadmium, fluoride, lead, lithium, and selenium due to apparent non-normal distributions and for beryllium, mercury, and thallium due to a high non-detect frequency. Upper tolerance limits and the final GWPSs are summarized in Table 2.

## **2.2.2 Evaluation of Potential Appendix IV SSLs**

A confidence interval was constructed for each Appendix IV parameter at each compliance well, except where previous lithium exceedances merited corrective action (see Section 2.2.3). Confidence limits were generally calculated parametrically ( $\alpha = 0.01$ ); however, non-parametric confidence limits were calculated in some cases (e.g., when the data did not appear to be normally distributed or when the non-detect frequency was too high). An SSL was concluded if the lower confidence limit (LCL) exceeded the GWPS (i.e., if the entire confidence interval exceeded the GWPS). Calculated confidence limits are shown in Attachment B.

The following SSLs were identified at the Mountaineer BAP for assessment monitoring:

- The LCL for arsenic exceeded the GWPS of 0.0100 mg/L at MW-1805 (0.0258 mg/L) and MW-1922D (0.416 mg/L).
- The LCL for molybdenum exceeded the GWPS of 0.100 mg/L at MW-1921 (0.420 mg/L).

As a result, either an alternative source demonstration for arsenic and/or molybdenum will be prepared in accordance with 40 CFR 257.95(g)(3)(ii) or an assessment of corrective measures will be initiated for these constituents. Additionally, the Mountaineer BAP will continue to monitor the groundwater monitoring network in accordance with the assessment monitoring program per 40 CFR 257.96(b).

## **2.2.3 Evaluation of Corrective Action Monitoring**

The selected remedy of Source Removal with Hydraulic Containment is considered complete when it meets the requirements of 40 CFR 257.98(c), including the requirement to achieve compliance with the GWPS at all points within the plume of contamination (40 CFR 257.98(c)(1)). For previously identified lithium exceedances, which are the subject of the current corrective measures, the upper confidence limit (UCL) of the confidence intervals constructed as described in Section 2.2.2 were compared to the GWPS provided in Table 2. If the UCL is above the GWPS, compliance with the GWPS has not been achieved. The following corrective action exceedances were identified:

- The UCL for lithium exceeded the GWPS of 0.0400 mg/L at MW-1605D (0.0682 mg/L), MW-1605S (0.0681 mg/L), MW-1606D (0.120 mg/L), MW-1606S (0.102 mg/L), MW-1607D (0.0993 mg/L), MW-1607S (0.108 mg/L), MW-1921 (0.0972 mg/L), MW-1922S (0.0623 mg/L), MW-1923 (0.1965 mg/L), MW-1924 (0.1129 mg/L), and MW-1925 (0.0893 mg/L).

For lithium exceedances, which are the subject of corrective measures, concentrations remain above the GWPS and implementation of the selected remedy will continue.

## **2.2.4 Establishment of Appendix III Prediction Limits**

Upper prediction limits (UPL) for Appendix III parameters were established in January 2018 following the background monitoring period (Geosyntec, 2018). Intrawell tests were used to evaluate potential SSIs for pH, whereas interwell tests were used to evaluate potential SSIs for

boron, calcium, chloride, fluoride, sulfate, and TDS. Intrawell and interwell prediction limits have been updated periodically during the assessment monitoring period as sufficient data became available.

Mann-Whitney (Wilcoxon rank-sum) tests were performed to determine whether the newer data are affected by a release from the WBAP. Because the interwell Appendix III limits and the Appendix IV GWPSSs are based on data from upgradient wells which we would not expect to have been impacted by a release, these tests were used for intrawell Appendix III tests only. Mann-Whitney tests were used to compare the medians of historical data (September 2016 – May 2020) to the new compliance samples (October 2020 – November 2022) for pH. Results were evaluated to determine if the medians of the two groups were similar at the 99% confidence level. Where no significant difference was found, the new compliance data were added to the background dataset. Where a statistically significant difference was found between the medians of the two groups, the data were reviewed to evaluate the cause of the difference and to determine if adding newer data to the background dataset, replacing the background dataset with the newer data, or continuing to use the existing background dataset was most appropriate. If the differences appeared to have been caused by a release, then the previous background dataset would have continued to be used. The complete Mann-Whitney test results and a summary of the significant findings can be found in Attachment B.

Prediction limits for the interwell tests were recalculated using data collected during the 2022 assessment monitoring events. New upgradient well data were tested for outliers prior to being added to the background dataset. Upgradient well data were also evaluated for statistically significant trends using the Sen's Slope/Mann-Kendall trend test, and the results are included in Attachment B. The updated prediction limits were calculated using a one-of-two retesting procedure, as during detection monitoring.

After the revised background set was established, a parametric or non-parametric analysis was selected based on the distribution of the data and the frequency of non-detect data. Estimated results less than the reporting limit (practical quantitation limit [PQL]) but above the method detection limit (MDL) – i.e., “J-flagged” data – were considered detections and the estimated results were used in the statistical analyses. Non-parametric analyses were selected for datasets with at least 50% non-detect data or datasets that could not be normalized. Parametric analyses were selected for datasets (either transformed or untransformed) that passed the Shapiro-Wilk / Shapiro-Francía test for normality. The Kaplan-Meier non-detect adjustment was applied to datasets with between 15% and 50% non-detect data. For datasets with fewer than 15% non-detect data, non-detect data were replaced with one half of the PQL. The selected analysis (i.e., parametric or non-parametric) and transformation (where applicable) for each background dataset are shown in Attachment B.

Interwell UPLs were updated for boron, calcium, chloride, fluoride, sulfate, and TDS using historical data through November 2022, and intrawell UPLs and lower prediction limits (LPLs) were previously calculated for pH using the historical data through May 2022 to represent background values. The updated prediction limits are summarized in Table 3. The prediction limits were calculated for a one-of-two retesting procedure; i.e., if at least one sample in a series of two does not exceed the UPL, or in the case of pH, is neither less than the LPL nor greater than the UPL, then it can be concluded that an SSI has not occurred. In practice, where the initial result

does not exceed the UPL, or in the case of pH, is neither less than the LPL nor greater than the UPL, a second sample will not be collected.

### **2.2.5 Evaluation of Potential Appendix III SSIs**

The Appendix III results were analyzed to assess whether concentrations of Appendix III parameters at the compliance wells exceeded background concentrations. Data collected during the November 2022 assessment monitoring event from each compliance well were compared to previously established prediction limits to assess whether the results are above background values. The results from these events and the prediction limits are summarized in Table 3. The following exceedances of the upper prediction limits (UPLs) were noted:

- Boron concentrations exceeded the interwell UPL of 0.491 mg/L at MW-1604D (3.59 mg/L), MW-1604S (2.37 mg/L), MW-1605D (2.69 mg/L), MW-1605S (3.63 mg/L), MW-1606D (6.37 mg/L), MW-1606S (4.94 mg/L), MW-1607D (4.56 mg/L), and MW-1607S (2.76 mg/L).
- Calcium concentrations exceeded the interwell UPL of 202 mg/L at MW-1604S (246 mg/L), MW-1605D (212 mg/L), and MW-1607D (222 mg/L).
- Chloride concentrations exceeded the interwell UPL of 57.8 mg/L at MW-1604D (60.9 mg/L), MW-1604S (96.1 mg/L), MW-1605D (99.3 mg/L), MW-1605S (81.4 mg/L), MW-1606D (191 mg/L), MW-1606S (169 mg/L), MW-1607D (165 mg/L), and MW-1607S (126 mg/L).
- Fluoride concentrations exceeded the interwell UPL of 0.300 mg/L at MW-1606S (0.36 mg/L), and MW-1607D (0.47 mg/L).
- Sulfate concentrations exceeded the interwell UPL of 530 mg/L at MW-1604S (622 mg/L), MW-1605D (566 mg/L), MW-1606D (585 mg/L), and MW-1607D (641 mg/L).
- TDS concentrations exceeded the interwell UPL of 1,010 mg/L at MW-1604D (1,060 mg/L), MW-1604S (1,340 mg/L), MW-1605D (1,270 mg/L), MW-1605S (1,180 mg/L), MW-1606D (1,380 mg/L), MW-1606S (1,300 mg/L), MW-1607D (1,560 mg/L), and MW-1607S (1,060 mg/L).

While the prediction limits were calculated for a one-of-two retesting procedure, SSIs were conservatively assumed if the November 2022 sample was above the UPL or below the LPL. Based on these results, concentrations of Appendix III constituents appear to be above background levels at the compliance wells.

## **2.3 Conclusions**

A semiannual corrective action monitoring event were conducted in accordance with the CCR Rule. The laboratory and field data were reviewed prior to statistical analysis, with no QA/QC issues identified that impacted data usability. A review of outliers identified no potential outliers

in the November 2022 data. GWPSs were established for the Appendix IV parameters. A confidence interval was constructed at each compliance, nature and extent, and sentinel well for each Appendix IV parameter; SSLs were concluded if the entire confidence interval exceeded the GWPS. SSLs were identified for arsenic and molybdenum. For previous lithium exceedances which are the subject of corrective measures, concentrations remain above the GWPS and implementation of the selected remedy will continue. Appendix III parameters were compared to previously calculated prediction limits, with exceedances identified for boron, calcium, chloride, fluoride, sulfate, and TDS.

Based on this evaluation, the Mountaineer BAP CCR unit will continue corrective action monitoring as required by 40 CFR 275.98(a)(1).

GROUNDWATER STATS  
CONSULTING

February 23, 2023

Geosyntec Consultants  
Attn: Ms. Allison Kreinberg  
500 W. Wilson Bridge Road, Suite 250  
Worthington, OH 43085

Re: Mountaineer Bottom Ash Pond  
Assessment Monitoring Report & Background Update – 2022

Dear Ms. Kreinberg,

Groundwater Stats Consulting (GSC), formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the background update and the Assessment Monitoring and Corrective Action statistical analysis of groundwater data through November 2022 at American Electric Power Company's Mountaineer Bottom Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at upgradient and downgradient wells for the CCR program in 2016. The monitoring well network, as provided by Geosyntec Consultants, consists of the following:

- **Upgradient wells:** MW-1601A, MW-1602, MW-1603, and MW-1608
- **Downgradient wells:** MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S
- **Nature and Extent wells:** JTMN-1, JTMN-2, MW-016, MW-107, MW-112, MW-1805, MW-1921, MW-1922D, MW-1922S, MW-1923, MW-1924, MW-1925, MW-1926, MW-1927, and MW-203
- **Sentinel well:** MW-1929

Note that sampling began at the nature and extent wells along with the sentinel well in 2019. Although new upgradient well MW-1928 is considered part of the well network, it has been dry since 2019; therefore, it is not listed above, nor included in this analysis.

Data were sent electronically, and the statistical analysis was conducted according to the Statistical Analysis Plan and screening evaluation prepared by GSC and approved by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance, and Senior Advisor to GSC. This analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series and box plots for Appendix III and IV parameters are provided for all wells and constituents and are used to evaluate concentrations over the entire record (Figures A and B, respectively). Values in background which have previously been flagged as outliers may be seen in a lighter font and disconnected symbol on the graphs. Additionally, a summary of flagged values follows this letter (Figure C). While the reporting limits may vary from well to well, a single reporting limit substitution is used across all wells for a given parameter in the time series plots since the wells are plotted as a group.

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient, nature and extent, and sentinel well/constituent pairs containing 100% non-detects follows this letter. For all constituents, a substitution of the most recent reporting limit is used for non-detect data. When calculating intrawell prediction limits, the substitution is performed for individual wells and may differ across wells. This generally gives the most conservative limit in each case.

### **Summary of Statistical Method – Appendix III & IV Parameters**

Based on the original background screening described in the 2017 screening report, the following statistical methods were selected for Appendix III parameters:

- 1) Intrawell prediction limits, combined with a 1-of-2 resample plan for pH
- 2) Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, sulfate, and TDS

Interwell upper tolerance limits, UTL's, are used to establish background limits for both Assessment Monitoring and Corrective Action Monitoring. A Ground Water Protection Standard, GWPS, for each Appendix IV constituent is then established using the higher of the background limit or a regulatory limit. A confidence interval for each downgradient well/constituent is compared against the corresponding GWPS. More details for both Assessment and Corrective Action monitoring are given below.

Parametric prediction and tolerance limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or most data are non-detects, a nonparametric test is utilized. While the annual false positive rate associated with parametric limits is fixed at 10% as recommended by the EPA Unified Guidance (2009), the false positive rate associated with nonparametric limits is not fixed and depends upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction and tolerance limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the introwell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In the interwell case, prediction limits are updated with upgradient well data following each sampling event after careful screening for any new outliers. In some cases,

deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

## **Summary of Appendix III Background Update Summaries**

### **November 2019**

Samples from all wells for pH which is tested using introwell prediction limits and from all upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS which are tested using interwell prediction limits were evaluated using Tukey's outlier test and visual screening.

The Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through June 2017 to the new compliance samples at each well through April 2019 for pH to evaluate whether the groups are statistically different at the 99% confidence level. No statistically significant differences were found between the two groups for any of the well/constituent pairs; therefore, all background data sets for pH were updated.

For parameters tested using interwell analyses, the Sen's Slope/Mann-Kendall trend test was used on upgradient wells to determine whether concentrations are statistically increasing, decreasing or stable. A few statistically significant increasing and decreasing trends were noted; however, the magnitudes of the trends were low relative to average concentrations within each well. Therefore, interwell prediction limits were constructed with using pooled upgradient well data through April 2019.

### **January 2021**

Prior to updating background data for the Fall 2020 analysis, Tukey's outlier test and visual screening were used to re-evaluate data for outliers at all wells for pH and at all upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS. High pH values for wells MW-1607D and MW-1607S were flagged as outliers and deselected prior to constructing prediction limits to maintain introwell prediction limits that are conservative (i.e., more pH neutral) from a regulatory perspective. An unusually high value for TDS in well MW-1606S was identified visually and flagged as an outlier. Since TDS is evaluated using interwell methods, the flagged value has no effect on the calculation of prediction limits. Tukey's

outlier test on pooled upgradient well data did not identify any potential outliers, and no new values were flagged.

For pH, which requires intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through April 2019 to the new compliance samples at each well through May 2020. No statistically significant differences were identified found between the two groups for pH; therefore, all background data sets for pH were updated using data through May 2020.

For parameters tested using interwell analyses (boron, calcium, chloride, fluoride, sulfate, and TDS) the Sen's Slope/Mann-Kendall trend test was used on upgradient wells to determine whether concentrations are statistically increasing, decreasing or stable. Although statistically significant trends were identified, the magnitudes of the trends above were either small relative to average concentrations within each well or would not greatly affect the interwell prediction limits. Therefore, all well/constituent pairs using interwell prediction limits were updated using data through October 2020.

## **January 2022**

Upgradient well data through October 2021 were re-screened for the purpose of updating the interwell prediction limits for boron, calcium, chloride, fluoride, sulfate, and TDS. Intrawell prediction limits will be updated after the Fall 2022 sample event when sufficient compliance samples are available.

Prior to updating interwell prediction limits, Tukey's outlier test and visual screening were used to re-evaluate data through October 2021 at all upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS. Tukey's outlier test on pooled upgradient well data did not identify any potential outliers, and no new values were flagged.

No changes to values flagged in previous background updates occurred. As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. A summary table of all flagged outliers follows this report.

Intrawell prediction limits, combined with a 1-of-2 resample plan, are constructed using historical data through May 2020 for pH at all wells. As discussed earlier, background data sets for pH will be updated after the Fall 2022 sample event when a minimum of 4 new compliance samples are available.

For parameters tested using interwell analyses (boron, calcium, chloride, fluoride, sulfate, and TDS) the Sen's Slope/Mann-Kendall trend test was used on upgradient wells to determine whether concentrations are statistically increasing, decreasing or stable. Statistically significant trends were identified for the following upgradient well/constituent pairs:

Increasing:

- Calcium: MW-1601A
- Fluoride: MW-1602
- Sulfate: MW-1601A
- TDS: MW-1601A

Decreasing:

- Boron: MW-1601A, MW-1603, and MW-1608
- Chloride: MW-1603
- Fluoride: MW-1601A
- Sulfate: MW-1603

The magnitudes of the trends above are either small relative to average concentrations within each well or would not greatly affect the interwell prediction limits. With limited background samples collected to date, all data from upgradient wells were used to construct interwell prediction limits for all Appendix III parameters except pH which is tested using intrawell prediction limits. As more data are collected, all upgradient well data will be re-evaluated for possible deselection of earlier measurements if they no longer represent present-day groundwater quality conditions.

Interwell prediction limits, combined with a 1-of-2 resample plan, were updated using all available data from upgradient wells through October 2021 for boron, calcium, chloride, fluoride, sulfate, and TDS. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent.

## **January 2023**

### Outlier Analysis

Prior to updating background data during this analysis, Tukey's outlier test was used to evaluate data through May 2022 at all wells for pH, which is tested using intrawell prediction limits, and through November 2022 at upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS, which are tested using interwell prediction limits. (Figure C).

Tukey's outlier test on all wells for pH and on pooled upgradient well data for boron, calcium, chloride, fluoride, sulfate, and TDS did not identify any potential outliers; however, the highest value for boron early in the record at upgradient well MW-1603 was flagged to reduce variation and construct statistical limits that are conservative (i.e., lower) from a regulatory perspective.

No changes to values flagged in previous background updates occurred. As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. A summary of all flagged outliers follows this report (Figure C).

#### Intrawell – Mann-Whitney Test

For pH, which is tested using intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through May 2020 to the new compliance samples at each well through May 2022 to evaluate whether the groups are statistically similar at the 99% confidence level, in which case background data may be updated with compliance data (Figure D). No statistically significant differences were found between the two groups for pH among wells that were tested; therefore, all data sets for pH were updated with compliance samples through May 2022.

#### Intrawell – Prediction Limits

Intrawell prediction limits using all historical data through May 2022 combined with a 1-of-2 resample plan, were constructed for pH and a summary of the limits follows this letter (Figure E).

#### Interwell – Trend Test Evaluation

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS to identify statistically significant increasing or decreasing trends at the 99% confidence level (Figure F). The results of the trend analyses showed statistically significant trends for the following well/constituent pairs:

Increasing:

- Calcium: MW-1601A
- Fluoride: MW-1602
- Sulfate: MW-1601A
- TDS: MW-1601A

Decreasing:

- Boron: MW-1601A, MW-1603, and MW-1608
- Chloride: MW-1602, MW-1603, and MW-1608
- Fluoride: MW-1601A
- pH: MW-1601A
- Sulfate: MW-1603

The magnitudes of the trends above are either small relative to average concentrations within each well or would not greatly affect the interwell prediction limits. While concentrations are higher earlier in the record for chloride at MW-1601A, present-day conditions among downgradient wells such as MW-1604D resemble these naturally occurring groundwater concentrations upgradient of the facility; therefore, this record was not truncated. All records will be re-evaluated during the next background update and, if earlier measurements are no longer representative of present-day conditions, the historical portion of the records will be deselected prior to construction of statistical limits.

### Interwell – Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all pooled upgradient well data through November 2022 for boron, calcium, chloride, fluoride, sulfate, and TDS (Figure G). Time series graphs are included with the statistical limits for graphical representation of concentrations over time at upgradient wells. A summary table of the updated limits may be found following this letter in the Prediction Limit Summary Tables.

### **Summary of Appendix IV Background Update – Conducted in January 2023**

#### Outlier Analysis

Prior to evaluating Appendix IV parameters, background (upgradient) data were screened through visual screening and Tukey's outlier test for potential outliers and extreme trending patterns that would lead to artificially elevated statistical limits. High outliers are also 'cautiously' flagged in the downgradient wells when they are clearly much different from the rest of the data. This is intended to be a regulatory conservative approach in that it will reduce the variance and thus reduce the width of parametric confidence intervals; although it will also reduce the mean and thus lower the entire interval. The intent is to better represent the actual downgradient mean.

For the January 2023 update, Tukey's outlier test on pooled upgradient well data did not identify any outliers; therefore, no new values were flagged. Additionally, no new values

were flagged among downgradient wells. Note that during the March/May 2022 analysis, a previously flagged high value of molybdenum in well MW-1604S was unflagged due to the observation being lower than present-day groundwater quality conditions.

Previous screenings identified high values for chromium in several wells (both upgradient and downgradient) during the November and December 2016 samples events. These values were flagged in the database as outliers as they did not appear to represent the population at these wells and do not represent current conditions. Additionally, several high values for antimony, arsenic, barium, cadmium, cobalt, fluoride, lead, and selenium were recorded during the December 2016 sample event for downgradient wells MW-1606D, MW-1607D, and MW-1607S. High values above the MCL were flagged and are likely the result of a systematic error since they all occurred for the same sample event.

For the September 2016 sample event, a high value of combined radium in well MW-1606D and for molybdenum in well MW-1604S as well as a low value for combined radium in well MW-1604S were identified visually and flagged as outliers. All flagged values may be seen on the Outlier Summary following this letter (Figure C).

### Interwell Upper Tolerance Limits

Upper tolerance limits were used to calculate background limits from pooled upgradient well data during the Fall 2022 statistical analysis using data through November 2022 for Appendix IV parameters (Figure H). Parametric tolerance limits are calculated, with a target of 95% confidence and 95% coverage, when data follow a normal or transformed-normal distribution. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were constructed using the highest background measurement. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. These limits are updated annually and will be updated again after the Fall 2023 sample event.

### Groundwater Protection Standards

Interwell upper tolerance limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule specified levels in the Groundwater Protection Standard (GWPS) table following this letter to determine the highest limit for use as the GWPS in the Confidence Interval comparisons (Figure I).

## Evaluation of Appendix IV Parameters – November 2022 Event

### Assessment Monitoring

Confidence intervals were then constructed for downgradient, nature and extent, and sentinel wells for each of the Appendix IV parameters using data through November 2022 (Figure J). As discussed above, the highest limit of the MCL, CCR-Rule specified level, or background limit was used to establish the GWPS. A statistically significant level (SSL) is declared only when the entire confidence interval is above a GWPS. Complete graphical results of the confidence intervals follow this letter. Note that for lithium at wells which exceeded the GWPS during the previous analysis were evaluated only under the Corrective Action protocols described below. Confidence interval exceedances were identified for the following well/constituent pairs:

- Arsenic: MW-1805 and MW-1922D
- Molybdenum: MW-1921

Note that the exceedances listed above occurred in nature and extent wells, and no exceedances were identified among compliance wells. Further research beyond the scope of this analysis would be required to determine whether the exceedances are reflective of natural groundwater quality or are a result of practices at the site.

### Corrective Action

In 2022, Mountaineer BAP entered Corrective Action protocols for lithium due to previously identified SSLs. Confidence intervals were constructed using data through November 2022 for this constituent at downgradient, nature and extent, and sentinel wells identified with SSL exceedances during Assessment Monitoring (Figure K). These confidence intervals are then compared to the same GWPS used in Assessment Monitoring to assess the effectiveness of remedial efforts over time. Only when the entire confidence interval is below the GWPS for a period of 3 years is the well/constituent pair declared to be in compliance with its respective standard.

Lithium will continue to be evaluated under Corrective Action protocols using confidence intervals for these well/constituent pairs during the Monitoring and Natural Attenuation program. In future analyses, if confidence interval exceedances are identified for lithium at additional wells during Assessment Monitoring, data from these wells will also be evaluated only within the Corrective Action protocols until compliance is achieved. Complete graphical results of the confidence intervals follow this letter. Exceedances were identified for the following well/constituent pairs:

- Lithium: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S, MW-1921, MW-1922S, MW-1923, MW-1924, and MW-1925

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for the Mountaineer Bottom Ash Pond. If you have any questions or comments, please feel free to contact us.

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 1/26/2023 2:29 PM View: Interwell PL  
 Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

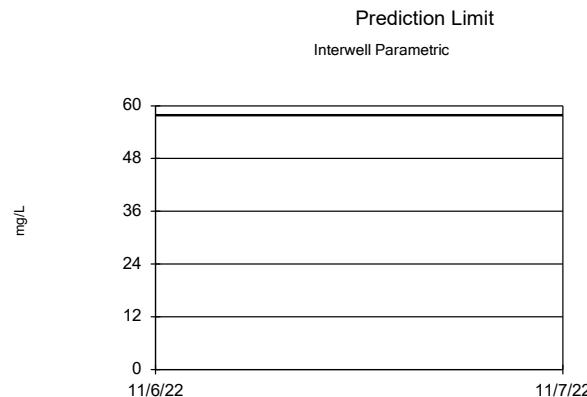

Background Data Summary (based on natural log transformation): Mean=-1.768, Std. Dev.=0.5472, n=83. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9694, critical = 0.96. Kappa = 1.931 (c=7, w=8, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0009403. Assumes 8 future values.

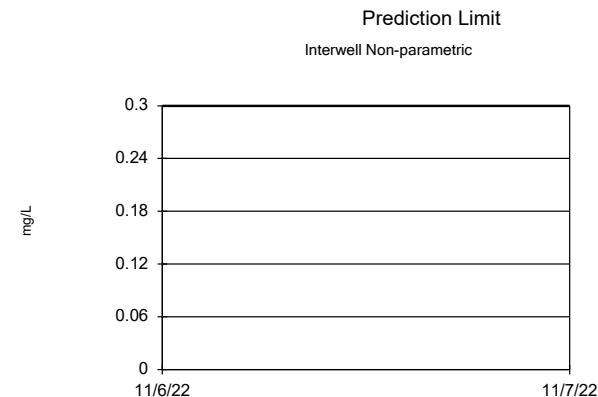

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 84 background values. Annual per-constituent alpha = 0.004366. Individual comparison alpha = 0.0002735 (1 of 2). Assumes 8 future values.

Background Data Summary (based on natural log transformation): Mean=2.442, Std. Dev.=0.837, n=84. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9813, critical = 0.96. Kappa = 1.93 (c=7, w=8, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0009403. Assumes 8 future values.

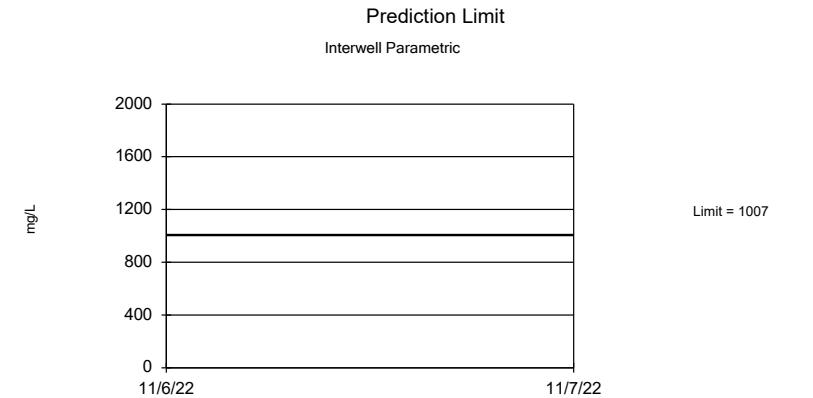

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 92 background values. Annual per-constituent alpha = 0.003642. Individual comparison alpha = 0.000228 (1 of 2). Assumes 8 future values.

### Parametric and Non-Parametric (NP) Confidence Interval

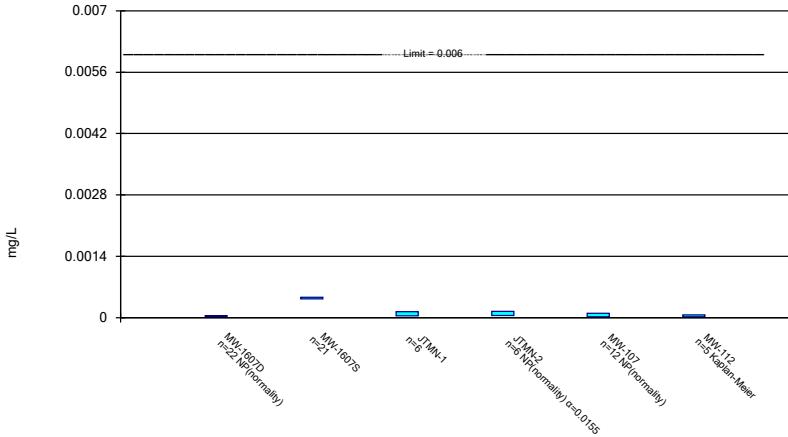

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony, total Analysis Run 2/22/2023 10:34 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosytec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

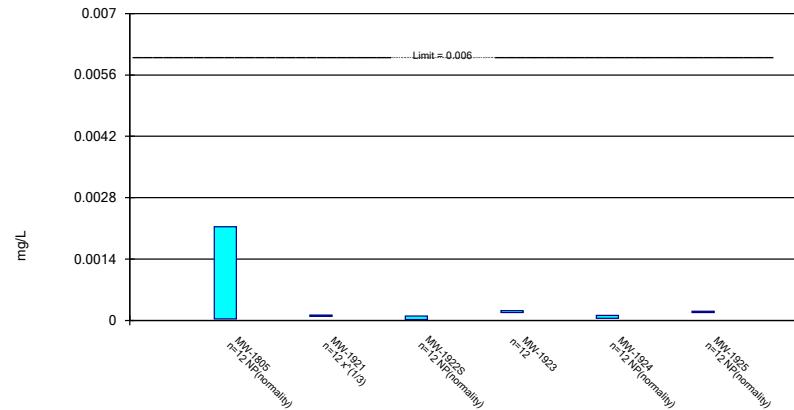

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

Constituent: Antimony, total Analysis Run 2/22/2023 10:34 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosytec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

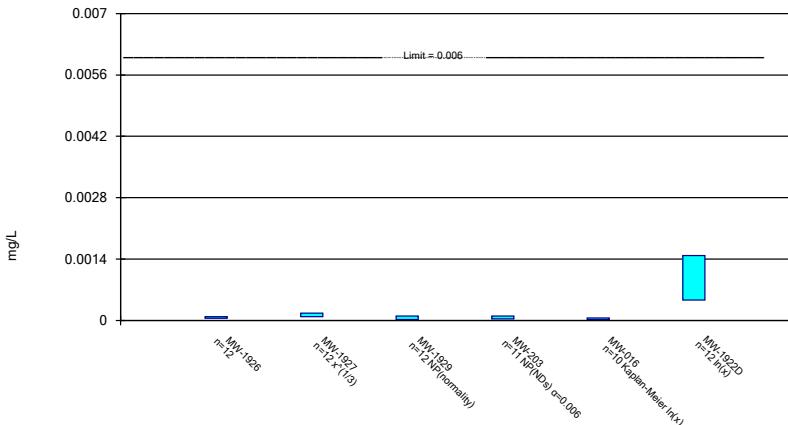

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony, total Analysis Run 2/22/2023 10:34 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosytec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

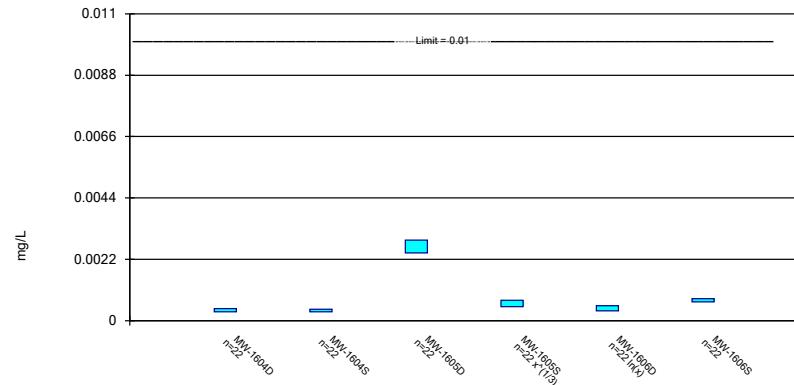

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

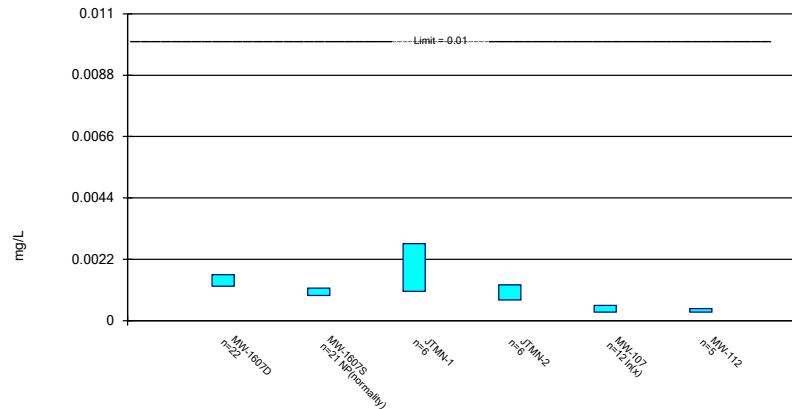

Constituent: Antimony, total Analysis Run 2/22/2023 10:34 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosytec Data: Mountaineer BAP

**Parametric Confidence Interval**

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

**Parametric and Non-Parametric (NP) Confidence Interval**

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

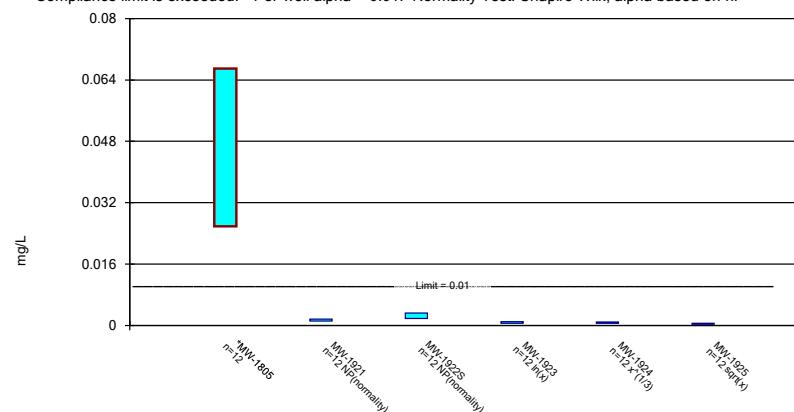

Constituent: Arsenic, total Analysis Run 2/22/2023 10:34 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

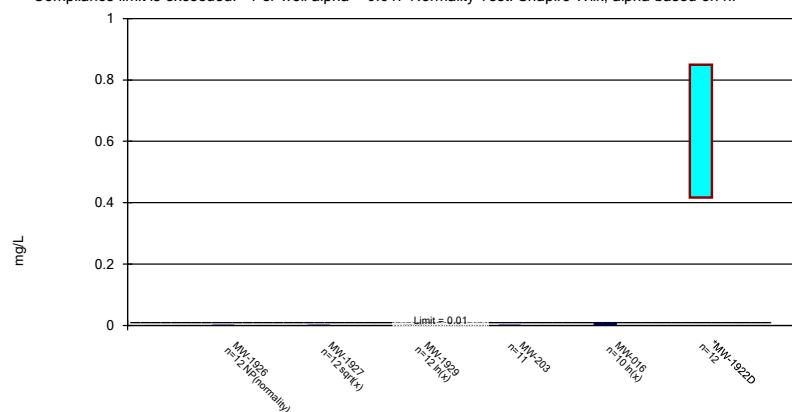

Constituent: Arsenic, total Analysis Run 2/22/2023 10:34 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

**Parametric and Non-Parametric (NP) Confidence Interval**

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

**Parametric and Non-Parametric (NP) Confidence Interval**

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

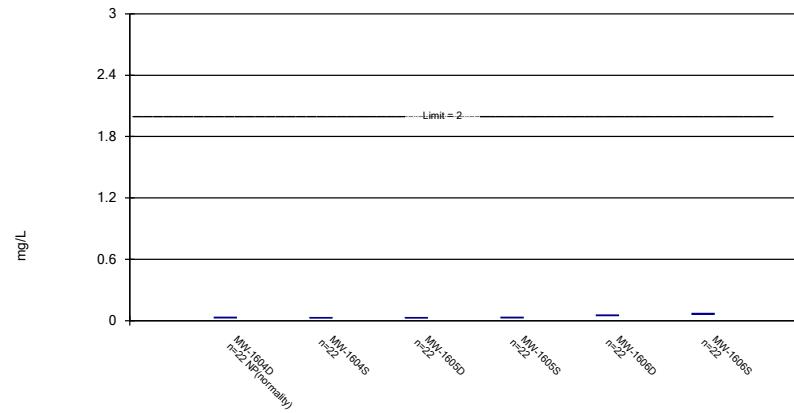

Constituent: Arsenic, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Arsenic, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

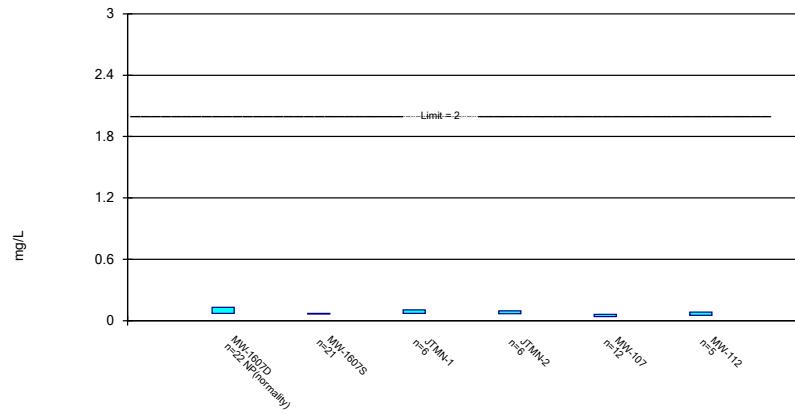

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

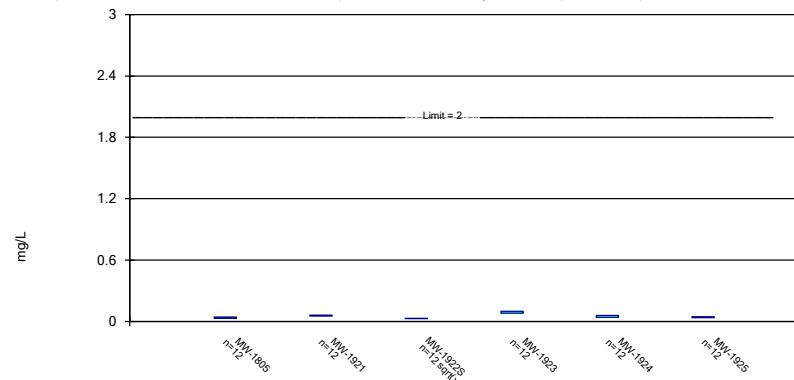

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

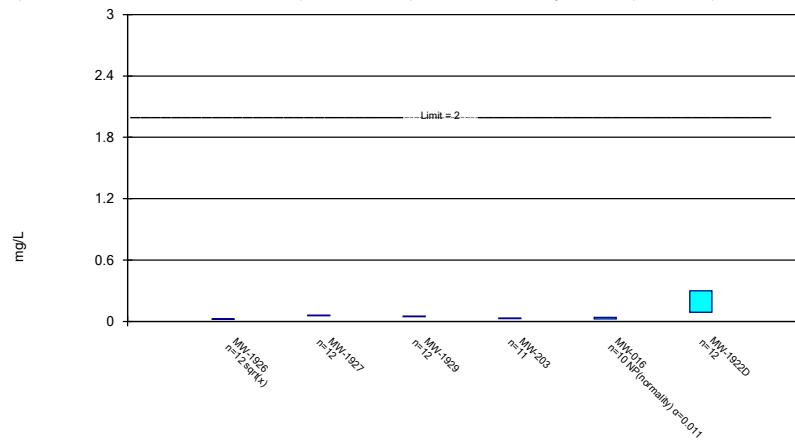

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

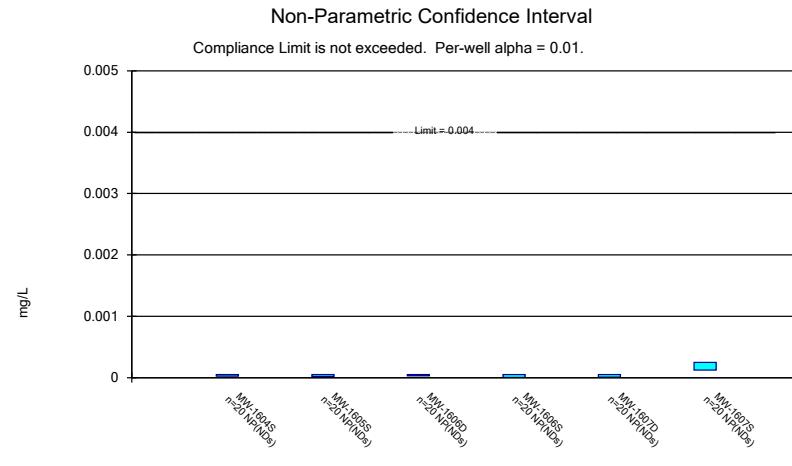

Constituent: Barium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

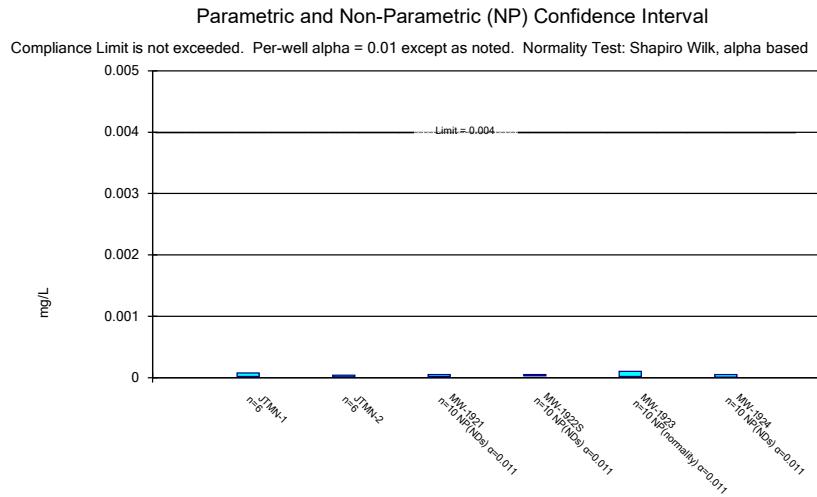

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

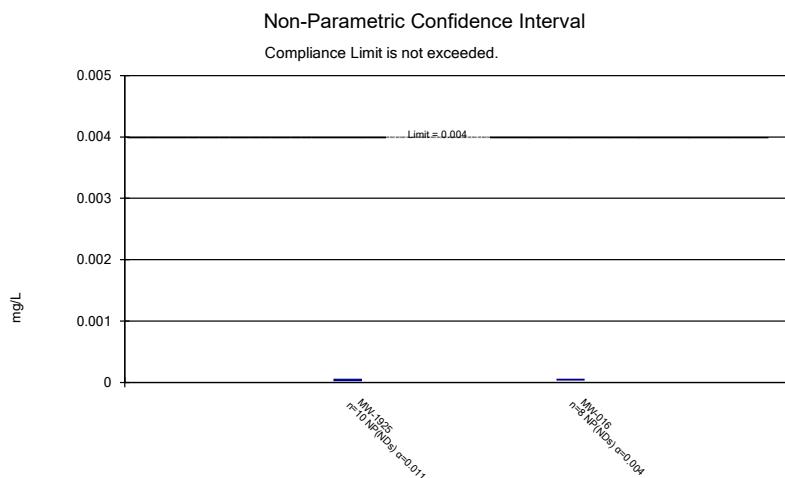

Constituent: Barium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

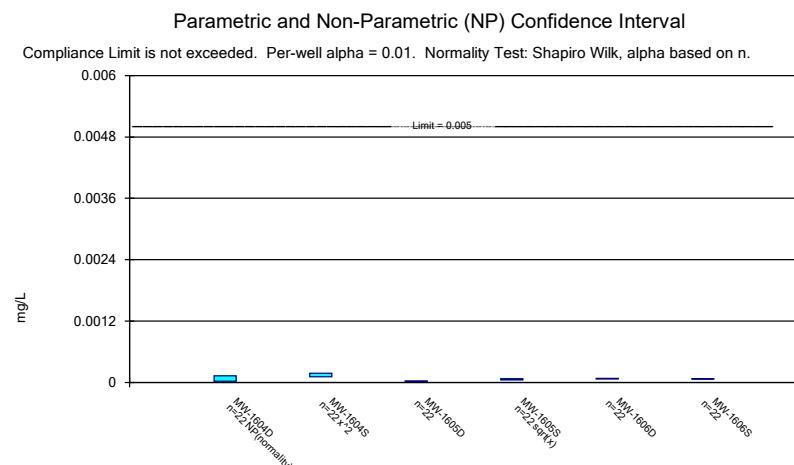

Constituent: Beryllium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Beryllium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

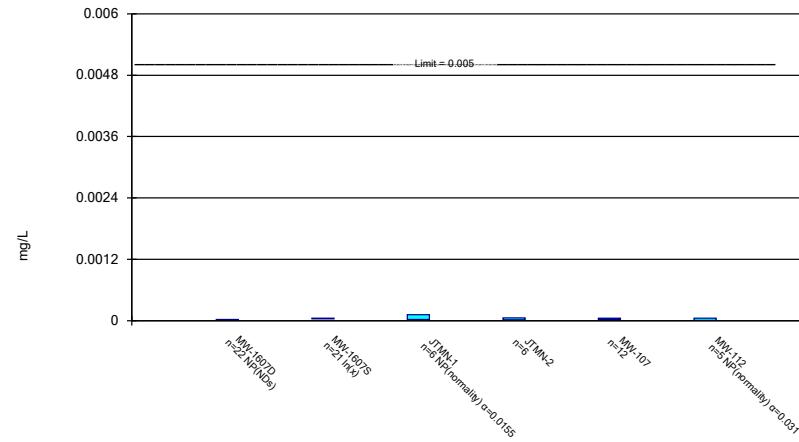

Constituent: Beryllium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Cadmium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

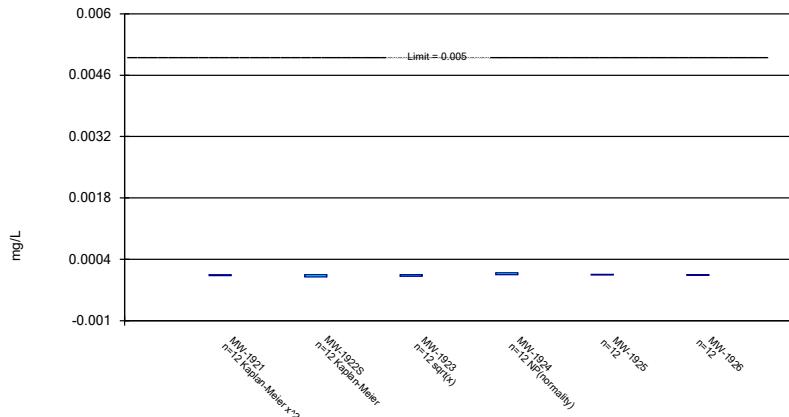

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

Constituent: Cadmium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

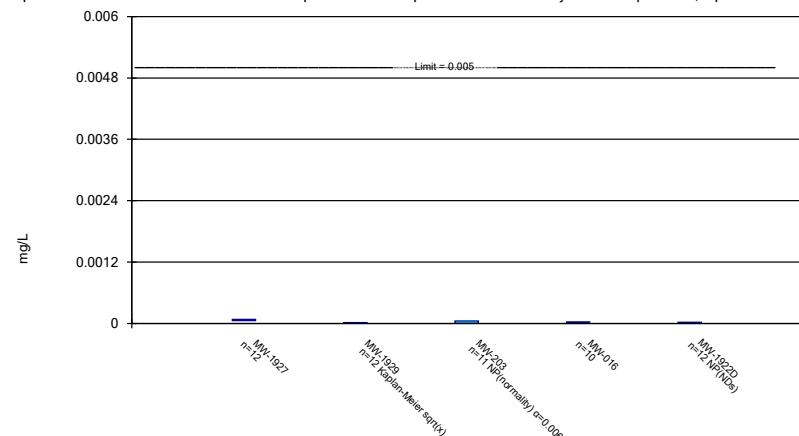

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

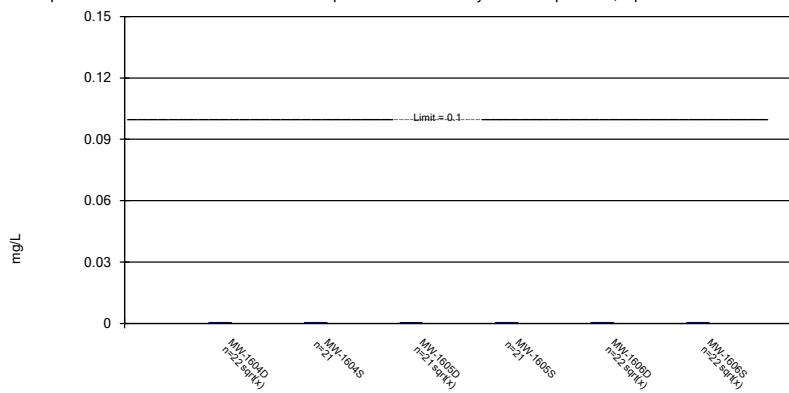

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

Constituent: Cadmium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

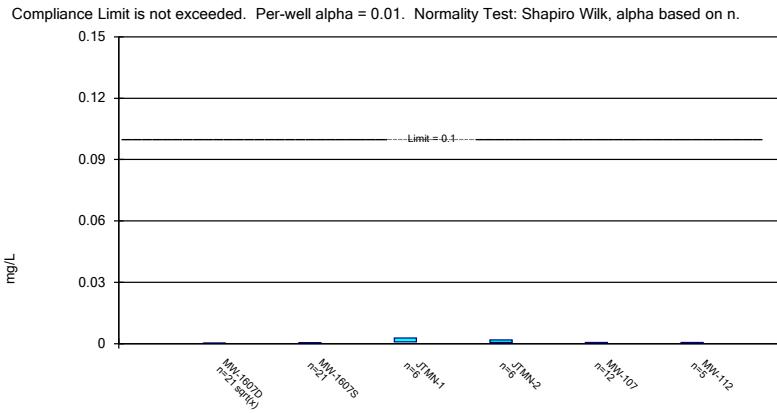

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

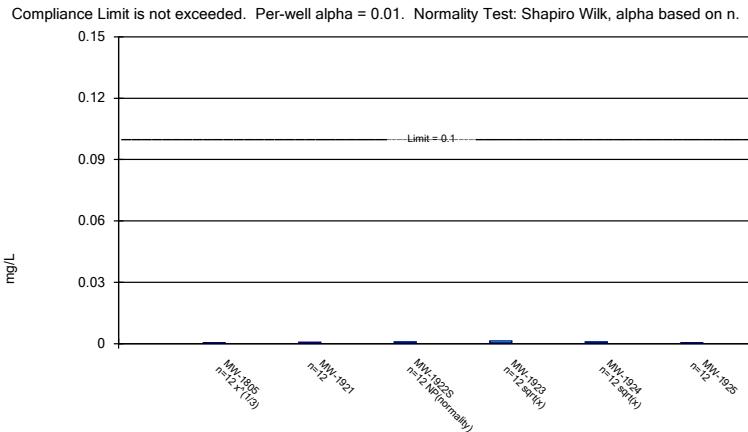

Constituent: Chromium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

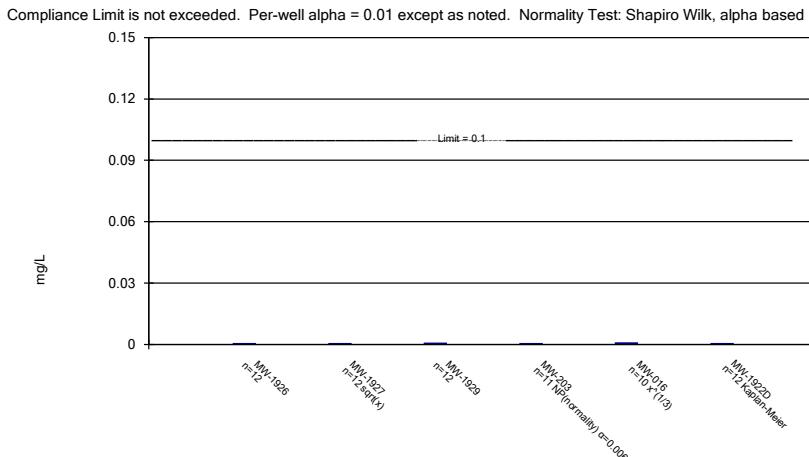

### Parametric and Non-Parametric (NP) Confidence Interval

Constituent: Chromium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

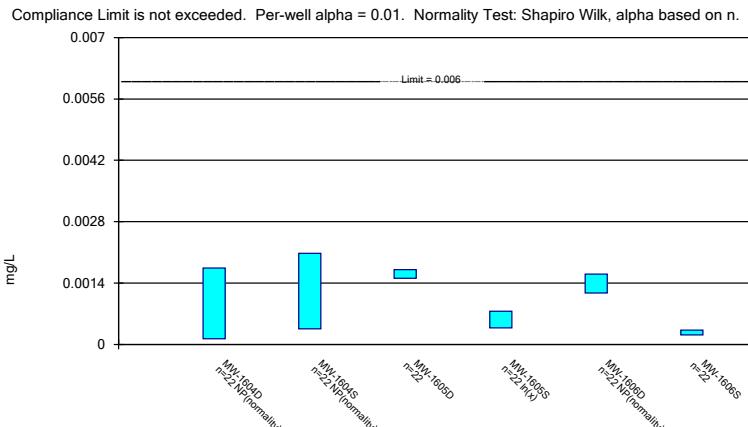

Constituent: Chromium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

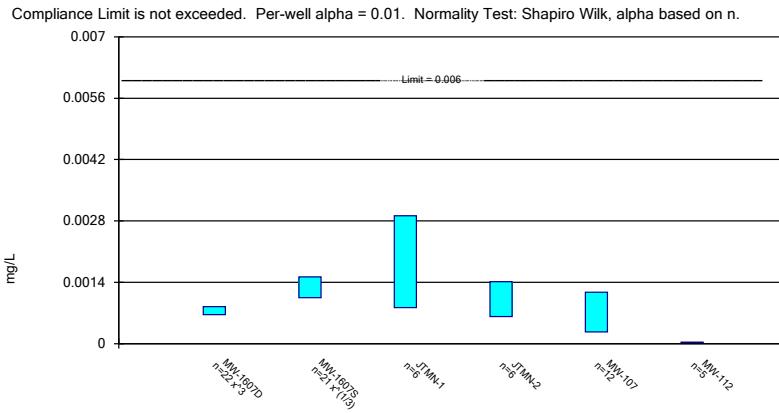

Constituent: Chromium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

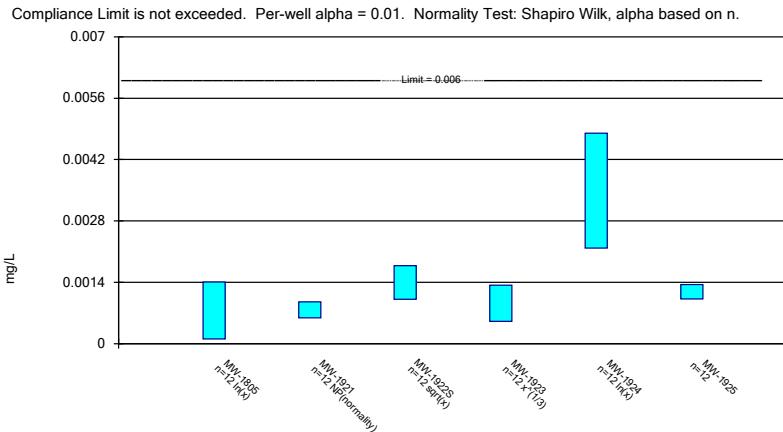

Constituent: Cobalt, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

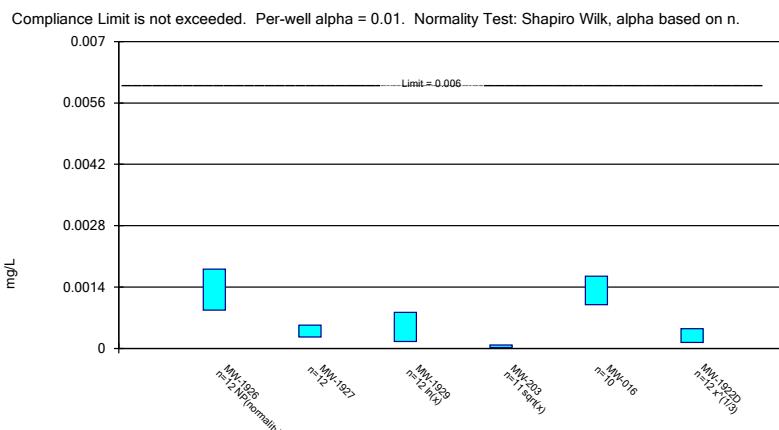

### Parametric and Non-Parametric (NP) Confidence Interval

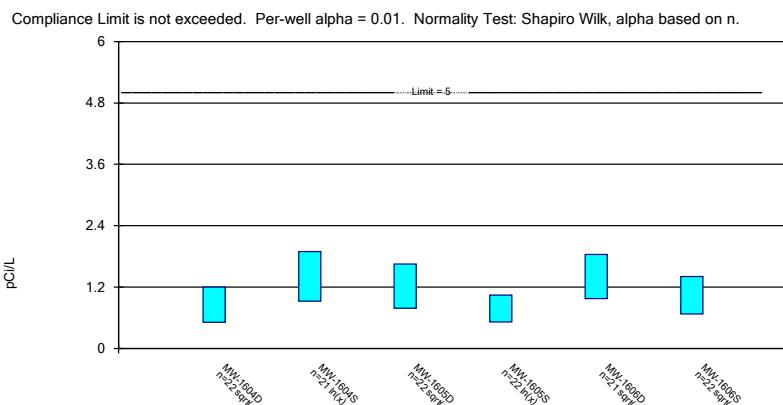

Constituent: Cobalt, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Cobalt, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

### Parametric Confidence Interval

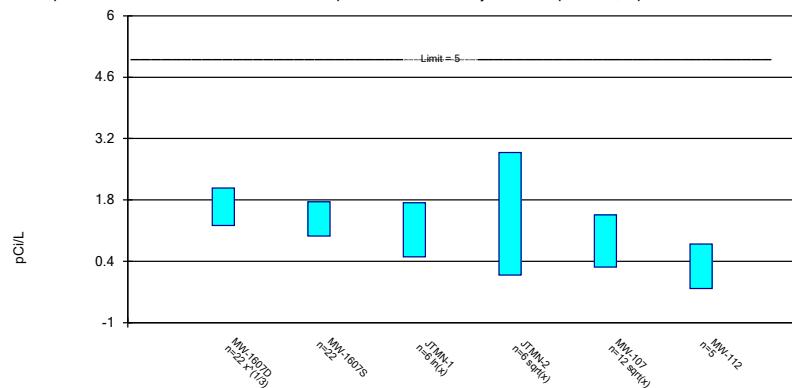

Constituent: Cobalt, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Combined Radium 226 + 228 Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

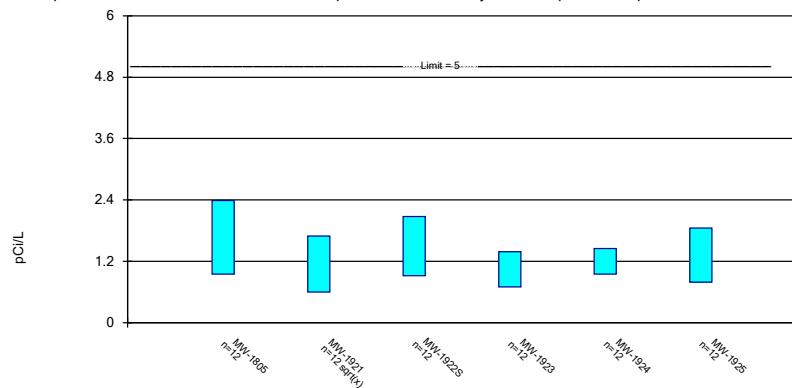

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

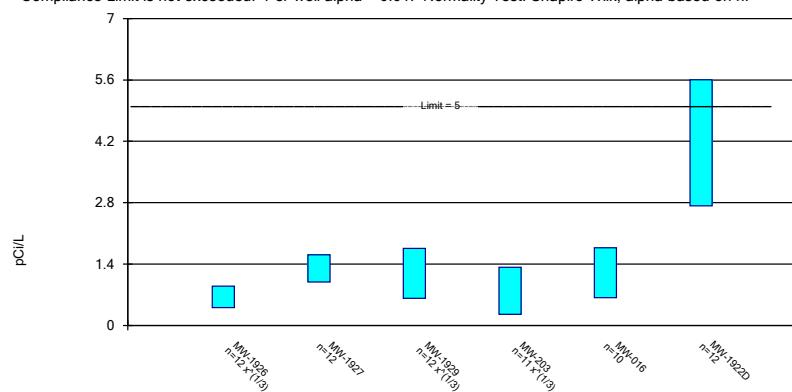

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

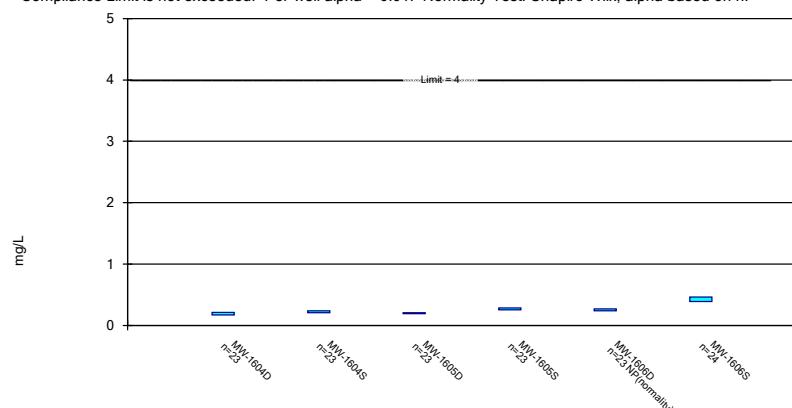

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

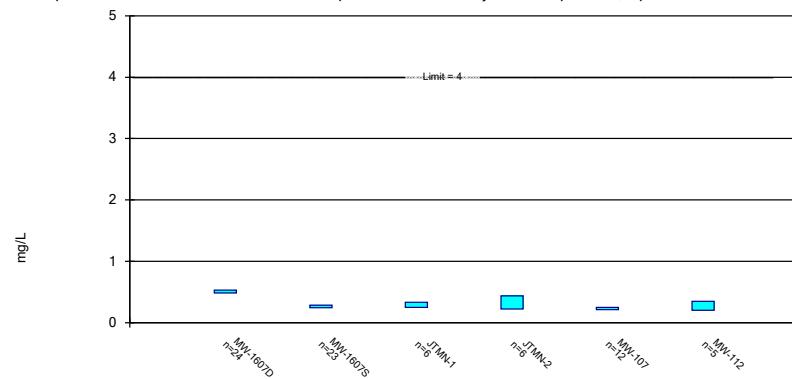

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

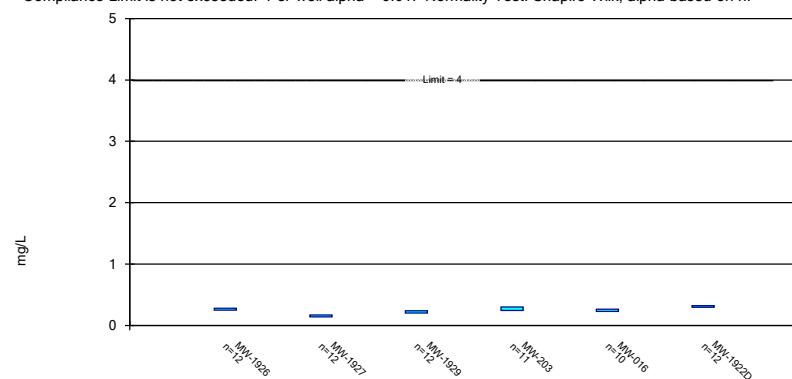

Constituent: Fluoride, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Fluoride, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

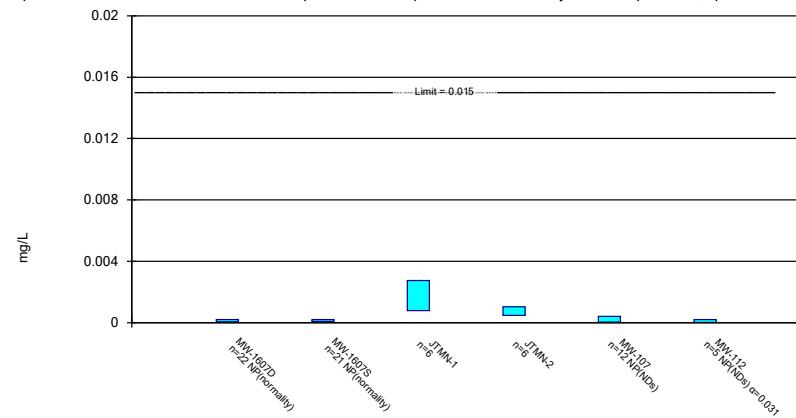

Constituent: Fluoride, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

Constituent: Lead, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

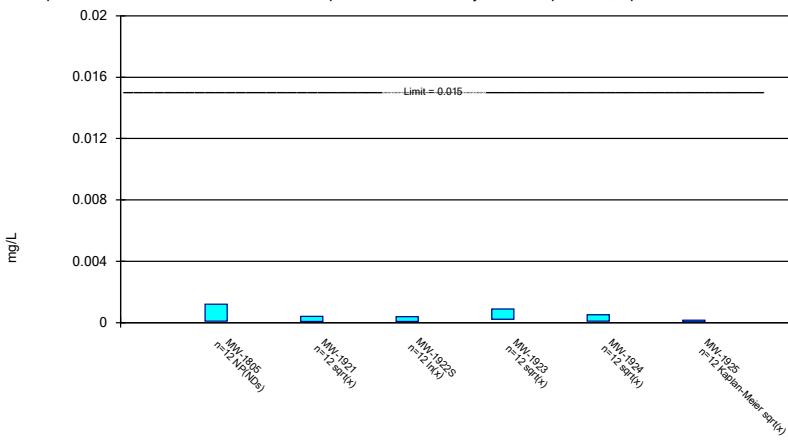

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

Constituent: Lead, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

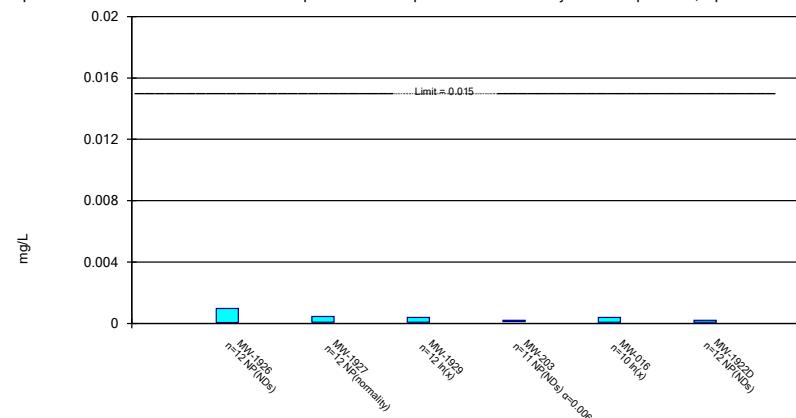

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

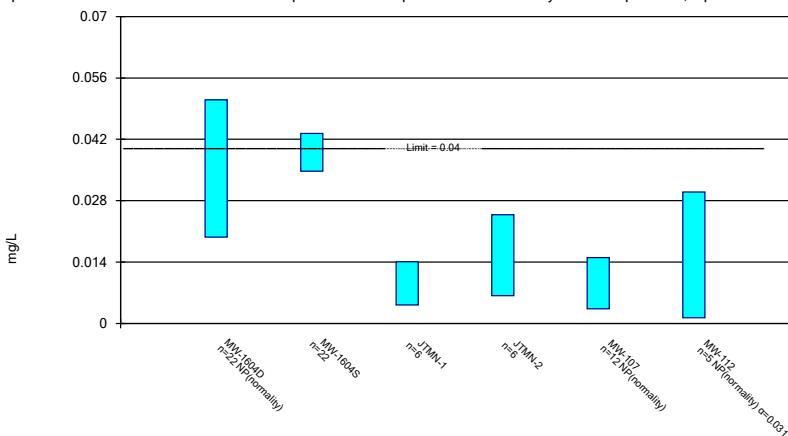

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

Constituent: Lead, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

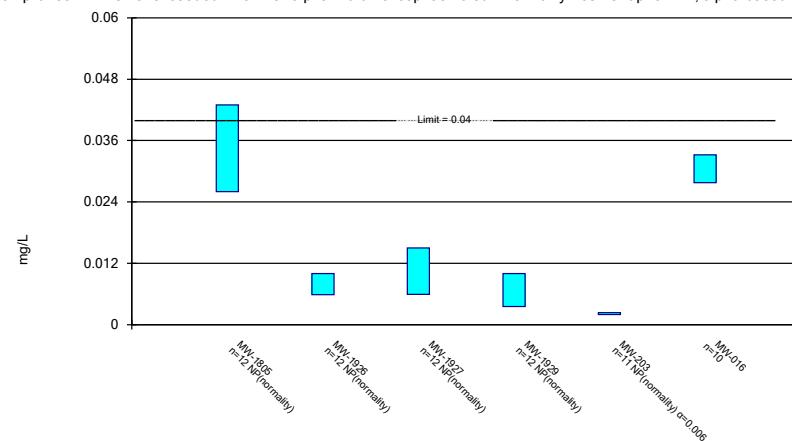

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

Constituent: Lithium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals  
Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

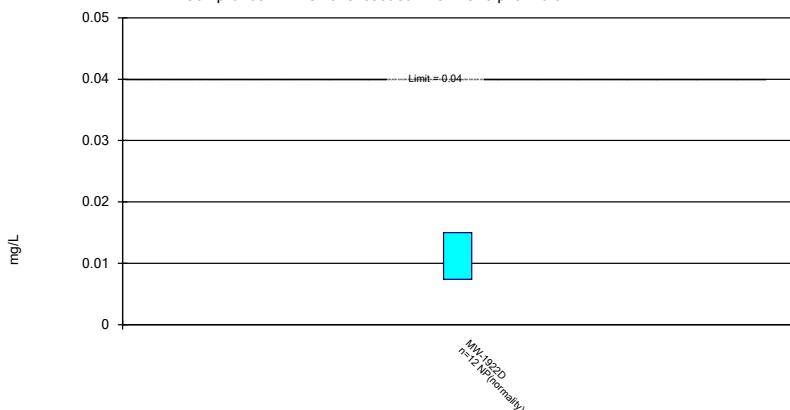

Constituent: Lithium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals

Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

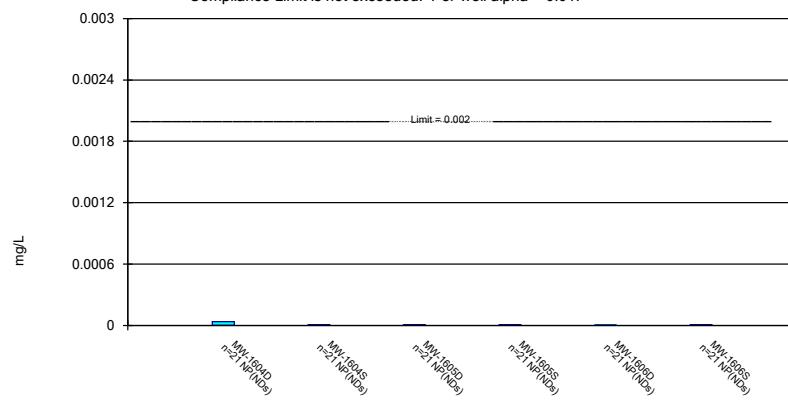

Constituent: Lithium, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals

Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

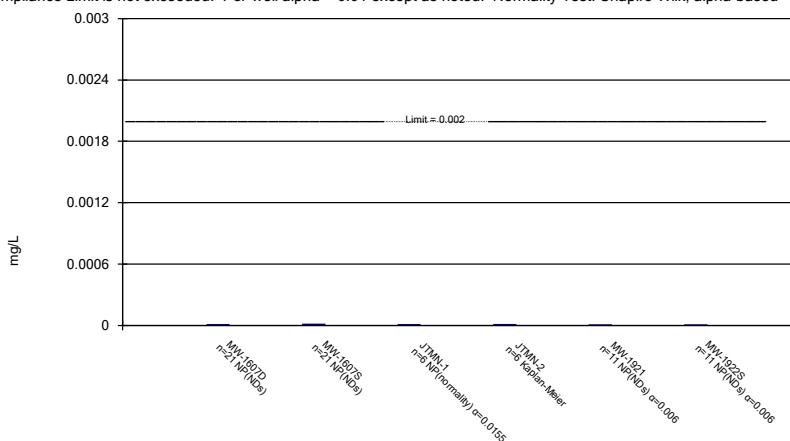

Constituent: Mercury, total Analysis Run 2/22/2023 10:35 AM View: Confidence Intervals

Mountaineer BAP Client: Geosyntec Data: Mountaineer BAP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based

## 1. INTRODUCTION

In accordance with United States Environmental Protection Agency (USEPA) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments (Code of Federal Regulations [CFR] Title 40, Section 257, Subpart D), groundwater monitoring has been conducted at the Bottom Ash Ponds (BAPs), an existing CCR unit at the Mountaineer Power Plant in New Haven, West Virginia. Recent groundwater monitoring results were used to identify concentrations of Appendix IV constituents that are above site-specific groundwater protection standards (GWPS) and to evaluate progress towards completion of the selected corrective action.

Based on detection monitoring conducted in 2017 and 2018, statistically significant increases (SSIs) over background were concluded for boron, calcium, chloride, total dissolved solids (TDS), and sulfate at the BAPs. An alternative source was not identified at the time, so the BAPs initiated assessment monitoring in April 2018. GWPSs were set in accordance with 40 CFR 257.95(d)(2), and a statistical evaluation of the assessment monitoring data was conducted in January 2019. Statistically significant levels (SSLs) were observed for lithium (Geosyntec Consultants, Inc. [Geosyntec] 2019).

An alternative source was not identified, so the BAPs initiated an assessment of corrective measures in accordance with 40 CFR 257.96. Source Removal and Hydraulic Containment was selected as the remedial approach for lithium exceedances at the BAPs (Sanborn, Head & Associates, Inc [Sanborn Head] 2021). Corrective action monitoring was initiated in 2022. With statistical analysis completed for the corrective action monitoring network, exceedances for arsenic and molybdenum were identified at select nature-and-extent monitoring wells (Geosyntec 2022). An alternative source demonstration (ASD) was completed for arsenic and molybdenum to document that the BAPs was not the source of these concentrations above the GWPSs; updates to the demonstration were completed following the most recent corrective action monitoring event (Geosyntec 2023a).

Corrective action monitoring events were conducted at the BAPs in March 2023 and May 2023 in accordance with 40 CFR 257.98(a)(1) and the *Corrective Action Monitoring Plan* (Sanborn Head 2022). The results of these corrective action monitoring events are documented in this report.

Groundwater data underwent several validation tests, including those for completeness, sample tracking accuracy, transcription errors, and consistent use of measurement units. No data quality issues that would impact data usability were identified.

The monitoring data were submitted to Groundwater Stats Consulting, LLC for statistical analysis. Confidence intervals were calculated for Appendix IV parameters at the compliance, nature-and-extent, and sentinel wells to assess whether Appendix IV parameters were present at SSLs above previously calculated GWPS. SSLs were identified for arsenic. Corrective action statistics identified concentrations of lithium above the GWPS. Therefore, the unit will continue corrective action monitoring as required by 40 CFR 275.98(a)(1). Certification of the selected statistical methods by a qualified professional engineer is documented in Attachment A.

## 2. BOTTOM ASH PONDS EVALUATION

### 2.1 Data Validation and QA/QC

During the corrective action monitoring program, two sets of samples were collected for analysis from the background and compliance wells to meet the requirements of 40 CFR 257.95(b) (March 2023) and 40 CFR 257.95(d)(1) (May 2023). The samples from both events were analyzed for all Appendix III and IV parameters. A summary of data collected during these assessment monitoring events may be found in Table 1.

Chemical analysis was completed by a National Environmental Laboratory Accreditation Program–certified analytical laboratory. The laboratory completed analysis of quality assurance and quality control (QA/QC) samples such as laboratory reagent blanks, continuing calibration verification samples, and laboratory fortified blanks.

The analytical data were imported into a Microsoft Access database, where checks were completed to assess the accuracy of sample location identification and analyte identification. Where necessary, unit conversions were applied to standardize reported units across all sampling events. Exported data files were created for use with the Sanitas™ v.9.6.35 statistics software. The export file was checked against the analytical data for transcription errors and completeness. No QA/QC issues that would impact data usability were noted.

### 2.2 Statistical Analysis

Statistical analyses for the BAPs were conducted in accordance with the January 2020 *Statistical Analysis Plan* (Geosyntec 2020). Time series plots and results for all completed statistical tests are provided in Attachment B.

The data obtained in March and May 2023 were screened for potential outliers; however, no outliers were identified in either set of data (Attachment B).

#### 2.2.1 Evaluation of Potential Appendix IV SSLs

A confidence interval was constructed for each Appendix IV parameter at each compliance well. Confidence limits were generally calculated parametrically ( $\alpha = 0.01$ ); however, nonparametric confidence limits were calculated in some cases (e.g., when the data were not normally distributed or when the nondetect frequency was too high). An SSL was concluded if the lower confidence limit (LCL) was above the GWPS (i.e., if the entire confidence interval was above the GWPS). The calculated confidence limits (Attachment B) were compared to the GWPSs provided in Table 2. The GWPSs were established during a previous statistical analysis as either (a) the background concentration or (b) the maximum contaminant level and risk-based levels specified in 40 CFR 257.95(h)(2), whichever was greater (Geosyntec 2023b).

The following SSLs were identified at the Mountaineer BAPs for assessment monitoring:

- The LCL for arsenic was above the GWPS of 0.0100 milligrams per liter (mg/L) at MW-1805 (0.0199 mg/L) and MW-1922D (0.423 mg/L).

As a result, either an ASD for arsenic will be prepared in accordance with 40 CFR 257.95(g)(3)(ii) or an assessment of corrective measures will be initiated for this constituent. Additionally, the Mountaineer BAPs will continue to monitor the groundwater monitoring network in accordance with the assessment monitoring program per 40 CFR 257.96(b).

It was previously noted that nature-and-extent well MW-1921 does not accurately represent groundwater conditions downgradient of the BAPs (Geosyntec 2023a). Statistical analyses were still completed for groundwater data at this location to support corrective action monitoring, but the analysis is no longer for compliance purposes. Results of the MW-1921 statistical analyses are provided in Attachment C. The following SSL was identified for MW-1921:

- The LCL for molybdenum was above the GWPS of 0.100 mg/L (0.418 mg/L).

Because this analysis was not completed for compliance purposes, an ASD is not required for the molybdenum concentrations observed at MW-1921.

## **2.2.2 Evaluation of Corrective Action Monitoring**

The selected remedy of Source Removal and Hydraulic Containment is considered complete when it meets the requirements of 40 CFR 257.98(c), including the requirement to achieve compliance with the GWPS at all points within the plume of contamination (40 CFR 257.98[c][1]). For previously identified lithium exceedances, which are the subject of the current corrective measures, the upper confidence limit (UCL) of the confidence intervals constructed as described in Section 2.2.1 were compared to the GWPSs provided in Table 2. If the UCL is above the GWPS, compliance with the GWPSs has not been achieved. The following corrective action exceedances were identified:<sup>1</sup>

- The UCL for lithium was above the GWPS of 0.0400 mg/L at MW-1605D (0.0661 mg/L), MW-1605S (0.0664 mg/L), MW-1606D (0.120 mg/L), MW-1606S (0.0983 mg/L), MW-1607D (0.0987 mg/L), MW-1607S (0.107 mg/L), MW-1922S (0.0594 mg/L), MW-1923 (0.200 mg/L), MW-1924 (0.107 mg/L), and MW-1925 (0.0859 mg/L).

For these lithium exceedances, which are the subject of corrective measures, concentrations remain above the GWPS, and the selected remedy will continue to be implemented.

Wells with confidence interval exceedances with visually apparent decreasing trends were further evaluated using Mann Kendall trend tests at the 95% confidence level, with confidence bands at 95% confidence around the trend line. Statistically significant decreasing trends were identified for lithium at MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1922S, MW-1924, and MW-1925. The 95% lower confidence band is below the lithium GWPS at MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1922S, and MW-1924. These results suggest the

---

<sup>1</sup> As discussed in Section 2.2.1, MW-1921 was also evaluated to support corrective action monitoring. The UCL for lithium at MW-1921 (0.0826 mg/L) was above the GWPS.

selected remedy is working as intended and lithium concentrations are decreasing downgradient of the BAPs.

### **2.2.3 Evaluation of Potential Appendix III SSIs**

The Appendix III results were analyzed to assess whether concentrations of Appendix III parameters at the compliance wells were above background concentrations. Data collected during the May 2023 assessment monitoring event from each compliance well were compared to previously established prediction limits to assess whether the results are above background values (Table 3). The following exceedances of the upper prediction limits (UPLs) were noted:

- Boron concentrations were above the interwell UPL of 0.491 mg/L at MW-1604D (0.566 mg/L), MW-1604S (1.90 mg/L), MW-1605D (3.15 mg/L), MW-1605S (3.28 mg/L), MW-1606D (4.07 mg/L), MW-1606S (3.33 mg/L), MW-1607D (4.16 mg/L), and MW-1607S (3.18 mg/L).
- Calcium concentrations were above the interwell UPL of 202 mg/L at MW-1604S (204 mg/L).
- Chloride concentrations were above the interwell UPL of 57.8 mg/L at MW-1604S (112 mg/L), MW-1605D (111 mg/L), MW-1605S (85.5 mg/L), MW-1606D (172 mg/L), MW-1606S (106 mg/L), MW-1607D (159 mg/L), and MW-1607S (138 mg/L).
- Fluoride concentrations were above the interwell UPL of 0.300 mg/L at MW-1606S (0.34 mg/L), and MW-1607D (0.46 mg/L).
- Sulfate concentrations were above the interwell UPL of 530 mg/L at MW-1604S (692 mg/L), MW-1605D (697 mg/L), MW-1605S (623 mg/L), MW-1606D (585 mg/L), and MW-1607D (629 mg/L).
- TDS concentrations were above the interwell UPL of 1,010 mg/L at MW-1604S (1,350 mg/L), MW-1605D (1,410 mg/L), MW-1605S (1,240 mg/L), MW-1606D (1,330 mg/L), MW-1606S (1,100 mg/L), MW-1607D (1,530 mg/L), and MW-1607S (1,140 mg/L).

While the prediction limits were calculated for a one-of-two retesting procedure, SSIs were conservatively assumed if the May 2023 sample was above the UPL or below the lower prediction limit. Based on these results, concentrations of Appendix III constituents appear to be above background levels at the compliance wells.

## **2.3 Conclusions**

Annual and semiannual corrective action monitoring events were conducted in accordance with the CCR Rule. The laboratory and field data were reviewed prior to statistical analysis, and no QA/QC issues that impacted data usability were identified. A review of outliers identified no potential outliers in the March 2023 or May 2023 data. A confidence interval was constructed at each compliance, nature-and-extent, and sentinel well for each Appendix IV parameter; SSLs were concluded if the entire confidence interval was above the GWPS. SSLs were identified for arsenic. For previous lithium exceedances, which are the subject of corrective measures, concentrations remain above the GWPSs, and the selected remedy will continue to be implemented. However,

statistically significant decreasing trends were observed for lithium at several locations in corrective action. Appendix III parameters were compared to previously calculated prediction limits, with exceedances identified for boron, calcium, chloride, fluoride, sulfate, and TDS.

Based on this evaluation, the Mountaineer BAPs CCR unit will continue corrective action monitoring as required by 40 CFR 275.98(a)(1).

GROUNDWATER STATS  
CONSULTING

July 6, 2023

Geosyntec Consultants  
Attn: Ms. Allison Kreinberg  
500 W. Wilson Bridge Road, Suite 250  
Worthington, OH 43085

Re: Mountaineer Bottom Ash Pond  
Assessment Monitoring Report & Corrective Action – 2023

Dear Ms. Kreinberg,

Groundwater Stats Consulting (GSC), formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the Assessment Monitoring and Corrective Action statistical analysis of groundwater data through May 2023 at American Electric Power Company's Mountaineer Bottom Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at upgradient and downgradient wells for the CCR program in 2016. The monitoring well network, as provided by Geosyntec Consultants, consists of the following:

- **Upgradient wells:** MW-1601A, MW-1602, MW-1603, and MW-1608
- **Downgradient wells:** MW-1604D, MW-1604S, MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, and MW-1607S
- **Nature and Extent wells:** JTMN-1, JTMN-2, MW-016, MW-107, MW-112, MW-1805, MW-1921, MW-1922D, MW-1922S, MW-1923, MW-1924, MW-1925, MW-1926, MW-1927, and MW-203
- **Sentinel well:** MW-1929

Note that sampling began at the nature and extent wells along with the sentinel well in 2019. Although new upgradient well MW-1928 is considered part of the well network, it has been dry since 2019; therefore, it is not listed above, nor included in this analysis.

Nature and extent well MW-112 was not sampled for this analysis and was last sampled in March 2022; therefore, it is also not included in this analysis.

As requested by Geosyntec Consultants, Inc., MW-1921 was analyzed and discussed separately from the other wells.

Data were sent electronically, and the statistical analysis was conducted according to the Statistical Analysis Plan and screening evaluation prepared by GSC and approved by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance, and Senior Advisor to GSC. This analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series and box plots for Appendix IV parameters are provided for all wells and constituents and are used to evaluate concentrations over the entire record (Figures A and B, respectively). Values in background which have previously been flagged as outliers may be seen in a lighter font and disconnected symbol on the graphs. Additionally, a summary of flagged values follows this letter (Figure C). While the reporting limits may vary from well to well, a single reporting limit substitution is used across all wells for a given parameter in the time series plots since the wells are plotted as a group.

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient, nature and extent, and sentinel well/constituent pairs containing 100% non-detects follows this letter. For all constituents, a substitution of the most recent reporting limit is used for non-detect data. When calculating confidence intervals, the substitution is performed for individual wells and may differ across wells. This generally gives the most conservative limit in each case.

### **Summary of Statistical Methods – Appendix IV Parameters**

Interwell upper tolerance limits (UTLs) are used to establish background limits for both Assessment Monitoring and Corrective Action Monitoring. A Groundwater Protection Standard (GWPS) for each Appendix IV constituent is then established using the higher of

the background limit or a regulatory limit. A confidence interval for each downgradient well/constituent is compared against the corresponding GWPS. More details for both Assessment and Corrective Action monitoring are given below.

Parametric tolerance limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (USEPA, 2009), data are analyzed using either parametric or non-parametric tolerance limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric tolerance limits are used on data containing greater than 50% non-detects.

## **Summary of Appendix IV Background Update – Conducted in January 2023**

### Outlier Analysis

Prior to evaluating Appendix IV parameters, background (upgradient) data were screened through visual screening and Tukey's outlier test for potential outliers and extreme trending patterns that would lead to artificially elevated statistical limits. High outliers are also 'cautiously' flagged in the downgradient wells when they are clearly much different from the rest of the data. This is intended to be a regulatory conservative approach in that it will reduce the variance and thus reduce the width of parametric confidence intervals; although it will also reduce the mean and thus lower the entire interval. The intent is to better represent the actual downgradient mean.

For the January 2023 update, Tukey's outlier test on pooled upgradient well data did not identify any outliers; therefore, no new values were flagged. Additionally, no new values were flagged among downgradient wells. Note that during the March/May 2022 analysis,

a previously flagged high value of molybdenum in well MW-1604S was unflagged due to the observation being lower than present-day groundwater quality conditions.

Previous screenings identified high values for chromium in several wells (both upgradient and downgradient) during the November and December 2016 samples events. These values were flagged in the database as outliers as the measurements did not appear to represent the population at these wells or current groundwater quality conditions. Additionally, several high values for antimony, arsenic, barium, cadmium, cobalt, fluoride, lead, and selenium were recorded during the December 2016 sample event for downgradient wells MW-1606D, MW-1607D, and MW-1607S. High values above the MCL were flagged and are likely the result of a systematic error since they all occurred for the same sample event.

For the September 2016 sample event, a high value of combined radium in well MW-1606D and for molybdenum in well MW-1604S as well as a low value for combined radium in well MW-1604S were identified visually and flagged as outliers. All flagged values may be seen on the Outlier Summary following this letter (Figure C).

#### Interwell Upper Tolerance Limits

Upper tolerance limits were used to calculate background limits from pooled upgradient well data during the Fall 2022 statistical analysis using data through November 2022 for Appendix IV parameters (Figure D). Parametric tolerance limits are calculated, with a target of 95% confidence and 95% coverage, when data follow a normal or transformed-normal distribution. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were constructed using the highest background measurement. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. These limits are updated annually and will be updated again after the Fall 2023 sample event.

#### Groundwater Protection Standards

Interwell upper tolerance limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule specified levels in the Groundwater Protection Standard (GWPS) table following this letter to determine the highest limit for use as the GWPS in the Confidence Interval comparisons (Figure E).

## Evaluation of Appendix IV Parameters – May 2023 Event

### Assessment Monitoring

Confidence intervals were constructed for downgradient, nature and extent, and sentinel wells for each of the Appendix IV parameters using data through May 2023 (Figure F). These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. When data followed a normal or transformed-normal distribution, parametric confidence intervals were used for Appendix IV parameters. The lower confidence limit, which is constructed with 99% confidence for parametric confidence intervals, is compared to the GWPS prepared as described above. Nonparametric confidence intervals were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The confidence level associated with nonparametric confidence intervals is dependent upon the number samples available.

As discussed above, the highest limit of the MCL, CCR-Rule specified level, or background limit was used to establish the GWPS. A statistically significant level (SSL) is declared only when the entire confidence interval is above a GWPS. Complete graphical results of the confidence intervals follow this letter. Note that lithium at wells which exceeded the GWPS during the previous analysis were evaluated only under the Corrective Action protocols described below. Confidence interval exceedances were identified for the following well/constituent pairs:

- Arsenic: MW-1805 and MW-1922D

Note that the exceedances listed above occurred in nature and extent wells, and no exceedances were identified among compliance wells. Further research beyond the scope of this analysis would be required to determine whether the exceedances are reflective of natural groundwater quality or are a result of practices at the site.

### Corrective Action

In 2022, Mountaineer BAP entered Corrective Action protocols for lithium due to previously identified SSLs. Confidence intervals were constructed using data through May 2023 for this constituent at downgradient, nature and extent, and sentinel wells identified with SSL exceedances during Assessment Monitoring (Figure G). These confidence intervals are then compared to the same GWPS used in Assessment Monitoring to evaluate the effectiveness of remedial efforts over time. Only when the entire confidence

interval is below the GWPS for a period of 3 years is the well/constituent pair declared to be in compliance with its respective standard.

Lithium will continue to be evaluated under Corrective Action protocols using confidence intervals for these well/constituent pairs during the Monitoring and Natural Attenuation program. In future analyses, if confidence interval exceedances are identified for lithium at additional wells during Assessment Monitoring, data from these wells will also be evaluated only within the Corrective Action protocols until compliance is achieved. Complete graphical results of the confidence intervals follow this letter. Exceedances were identified for the following well/constituent pairs:

- Lithium: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S, MW-1922S, MW-1923, MW-1924, and MW-1925

#### Trend Tests

Data at wells with confidence interval exceedances with visually apparent decreasing trends are further evaluated using the Sen's Slope/Mann Kendall trend test at the 95% confidence level with confidence bands at 95% confidence around the trend line to determine whether concentrations are statistically increasing, decreasing, or stable (Figure H). The 95% confidence level will identify whether statistically significant trends are present more rapidly and, therefore, is used in this analysis. The following well/constituent pairs meet these criteria:

- Lithium: MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1922S, MW-1924, and MW-1925

A summary of the Appendix IV trend test results follows this letter. Statistically significant decreasing trends were identified for each of the well/constituent pairs listed above.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for the Mountaineer Bottom Ash Pond. If you have any questions or comments, please feel free to contact us.

GROUNDWATER STATS  
CONSULTING

July 6, 2023

Geosyntec Consultants  
Attn: Ms. Allison Kreinberg  
500 W. Wilson Bridge Road, Suite 250  
Worthington, OH 43085

Re: Mountaineer Bottom Ash Pond  
Assessment Monitoring Report & Corrective Action – 2023  
Well MW-1921

Dear Ms. Kreinberg,

Groundwater Stats Consulting (GSC), formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the Assessment Monitoring and Corrective Action statistical analysis of groundwater data for Nature and Extent well MW-1921 through May 2023 at American Electric Power Company's Mountaineer Bottom Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009). Sampling began at this well in 2019.

Data were sent electronically, and the statistical analysis was conducted according to the Statistical Analysis Plan and screening evaluation prepared by GSC and approved by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance, and Senior Advisor to GSC. This analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series and box plots for Appendix IV parameters are provided for all wells and constituents and are used to evaluate concentrations over the entire record (Figures A and B, respectively). Values in background which have previously been flagged as outliers may be seen in a lighter font and disconnected symbol on the graphs. While the reporting limits may vary from well to well, a single reporting limit substitution is used across all wells for a given parameter in the time series plots since the wells are plotted as a group.

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. Since all wells contained less than 100% non-detects, all constituents were analyzed for nature and extent well MW-1921. For all constituents, a substitution of the most recent reporting limit is used for non-detect data. When calculating confidence intervals, the substitution is performed for individual wells and may differ across wells. This generally gives the most conservative limit in each case.

### **Summary of Statistical Methods – Appendix IV Parameters**

Interwell upper tolerance limits (UTLs) are used to establish background limits for both Assessment Monitoring and Corrective Action Monitoring. A Groundwater Protection Standard (GWPS) for each Appendix IV constituent is then established using the higher of the background limit or a regulatory limit. A confidence interval for each downgradient well/constituent is compared against the corresponding GWPS. More details for both Assessment and Corrective Action monitoring are given below.

Parametric tolerance limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (USEPA, 2009), data are analyzed using either parametric or non-parametric tolerance limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.

- Nonparametric tolerance limits are used on data containing greater than 50% non-detects.

## **Summary of Appendix IV Background Update – Conducted in January 2023**

### Outlier Analysis

Prior to evaluating Appendix IV parameters, background (upgradient) data were screened through visual screening and Tukey's outlier test for potential outliers and extreme trending patterns that would lead to artificially elevated statistical limits. High outliers are also 'cautiously' flagged in the downgradient wells when they are clearly much different from the rest of the data. This is intended to be a regulatory conservative approach in that it will reduce the variance and thus reduce the width of parametric confidence intervals; although it will also reduce the mean and thus lower the entire interval. The intent is to better represent the actual downgradient mean. For the January 2023 update, Tukey's outlier test on pooled upgradient well data did not identify any outliers for nature and extent well MW-1921; therefore, no values were flagged as outliers.

### Interwell Upper Tolerance Limits

Upper tolerance limits were used to calculate background limits from pooled upgradient well data during the Fall 2022 statistical analysis using data through November 2022 for Appendix IV parameters (Figure C). Parametric tolerance limits are calculated, with a target of 95% confidence and 95% coverage, when data follow a normal or transformed-normal distribution. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were constructed using the highest background measurement. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. These limits are updated annually and will be updated again after the Fall 2023 sample event.

### Groundwater Protection Standards

Interwell upper tolerance limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule specified levels in the Groundwater Protection Standard (GWPS) table following this letter to determine the highest limit for use as the GWPS in the Confidence Interval comparisons (Figure D).

## **Evaluation of Appendix IV Parameters – Well MW-1921 – May 2023**

### Assessment Monitoring

Confidence intervals were constructed for all Appendix IV parameters under assessment monitoring protocols, except for lithium which was evaluated under corrective action protocols, and compared to the GWPS described above (Figures E and F, respectively). These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. When data followed a normal or transformed-normal distribution, parametric confidence intervals were used for Appendix IV parameters. The lower confidence limit, which is constructed with 99% confidence for parametric confidence intervals, is compared to the GWPS prepared as described above. Nonparametric confidence intervals were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The confidence level associated with nonparametric confidence intervals is dependent upon the number samples available.

As discussed above, the highest limit of the MCL, CCR-Rule specified level, or background limit was used to establish the GWPS. A statistically significant level (SSL) is declared only when the entire confidence interval is above a GWPS. Complete graphical results of the confidence intervals follow this letter. An exceedance was identified for the following constituent:

- Molybdenum: MW-1921

### Corrective Action

In 2022, Mountaineer BAP entered Corrective Action protocols for lithium due to previously identified SSLs. Confidence intervals were constructed using data through May 2023 for this constituent at nature and extent well MW-1921. These confidence intervals are then compared to the same GWPS used in Assessment Monitoring to evaluate the effectiveness of remedial efforts over time. Only when the entire confidence interval is below the GWPS for a period of 3 years is the well/constituent pair declared to be in compliance with its respective standard.

Lithium will continue to be evaluated under Corrective Action protocols using confidence intervals for these well/constituent pairs during the Monitoring and Natural Attenuation program. In future analyses, if confidence interval exceedances are identified for lithium at additional wells during Assessment Monitoring, data from these wells will also be evaluated only within the Corrective Action protocols until compliance is achieved.

Complete graphical results of the confidence intervals follow this letter. An exceedance was identified for the following constituent:

- Lithium: MW-1921

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for the Mountaineer Bottom Ash Pond. If you have any questions or comments, please feel free to contact us.

For Groundwater Stats Consulting,

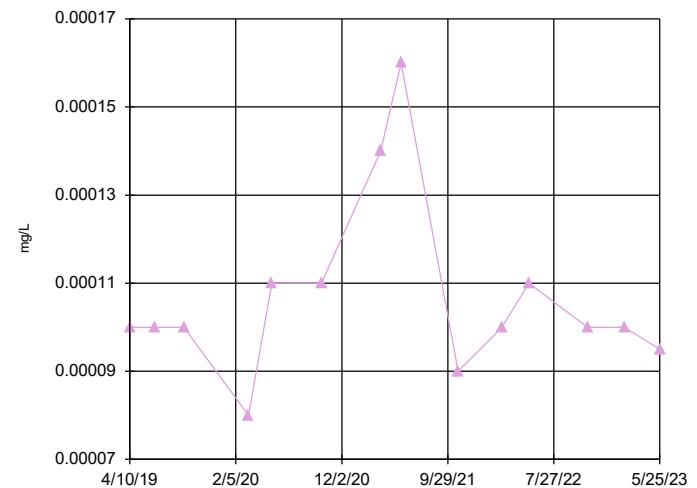

Tristan Clark  
Groundwater Analyst

XRF	X-ray fluorescence

## 1. INTRODUCTION AND SUMMARY

This Alternative Source Demonstration (ASD) report has been prepared to address statistically significant levels (SSLs) of arsenic and molybdenum in the groundwater monitoring network at the Mountaineer Power Plant's bottom ash ponds (BAPs) in New Haven, West Virginia.

This ASD follows the second semiannual corrective action monitoring event of 2022, which was conducted in November at the BAPs in accordance with Title 40, Section 257.98(a)(1) of the Code of Federal Regulations (CFR). The monitoring data were submitted to Groundwater Stats Consulting, LLC for statistical analysis. A confidence interval was constructed for each Appendix IV parameter at each compliance well, nature-and-extent well, and sentinel well. An SSL was attributed to a parameter if its lower confidence limit (LCL) exceeded the groundwater protection standard (GWPS) (i.e., if the entire confidence interval exceeded the GWPS).

The GWPS was established as whichever was greater of: (1) the background concentration (determined via calculation of an upper tolerance limit [UTL]), or (2) the maximum contaminant level (MCL) and risk-based level specified in 40 CFR 257.95(h)(2). The following SSLs were identified at the Mountaineer BAPs (Geosyntec 2023):

- Arsenic at MW-1805 and MW-1922D, both of which are screened in the underlying Monongahela bedrock Formation
- Lithium at MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S, MW-1921, MW-1922S, MW-1923, MW-1924, and MW-1925, all of which are screened in the sand and gravel aquifer
- Molybdenum at MW-1921, which is also screened in the sand and gravel aquifer

Corrective measures are currently being completed at the BAPs for previously identified lithium SSLs. Source removal and hydraulic containment was selected as the remedy for groundwater impacts of lithium associated with the BAPs (Sanborn Head 2021). Therefore, alternative sources were not evaluated for lithium in this demonstration.

### 1.1 CCR Rule Requirements

In accordance with the United States Environmental Protection Agency (USEPA) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments, 40 CFR 257.95(g)(3)(ii) states the following:

The owner or operator may demonstrate that a source other than the CCR unit caused the contamination, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. Any demonstration must be supported by a report that includes the factual or evidentiary basis for any conclusions and must be certified by a qualified professional engineer.

Pursuant to 40 CFR 257.95(g)(3)(ii), Geosyntec Consultants, Inc. (Geosyntec) has prepared this ASD report to document whether the SSLs identified for arsenic and molybdenum are from a source other than the BAPs.

## 1.2 Demonstration of Alternative Sources

An evaluation was completed to assess possible alternative sources of arsenic and molybdenum to which identified SSLs could be attributed. Alternative sources were identified among the following five types:

- ASD Type I: Sampling Causes
- ASD Type II: Laboratory Causes
- ASD Type III: Statistical Evaluation Causes
- ASD Type IV: Natural Variation
- ASD Type V: Alternative Sources

A demonstration was conducted to assess whether the SSLs of arsenic at MW-1805 and MW-1922D and molybdenum at MW-1921 were based on Type IV (Natural Variation) or Type V (Alternative Sources) causes and not caused by a release from the BAPs.

## 2. SUMMARY OF SITE CONDITIONS

Brief descriptions of the site construction, geology, and hydrogeology are provided below.

### 2.1 Site Construction and Location

The BAP CCR unit consist of two ponds of roughly equal size (BAP East and BAP West) with a combined surface area of approximately 28 acres. The BAP West has a normal pool area of 14.1 acres and the BAP East has a normal pool area of 13.9 acres (Arcadis 2016). The BAPs were constructed between 1978 and 1980 with a 3-foot-thick clay liner.

Several non-CCR-regulated ponds are located immediately south of the BAPs and, together with the BAPs, form the Site Pond Complex (**Figure 1**). An electrical substation is located northwest of the BAPs. A former Philip Sporn (Sporn) bituminous coal mining facility is located to the west of the BAPs. A 60-acre fly ash pond associated with the former Sporn Power Plant is located to the northeast of the BAPs (**Figure 1**).

The Sporn Power Plant was a generating facility that operated from the early 1950s until 2015. The Sporn fly ash pond received wet fly ash sluiced from Sporn's coal-fired steam electric generation Unit 5, runoff from the coal storage yard, water from the sump in the Sporn Mine, and wastewater from the boiler room sumps (EPRI 1999).

### 2.2 Regional Geology

Beneath the clay liner, the BAPs are immediately underlain by Quaternary alluvial deposits consisting of clay, silt, sand, and gravel. The unconsolidated alluvial deposits consist of the following two units (Sanborn Head 2020):

- Alternating horizons of clay and clayey silt, with thicknesses ranging from 0 to 30 feet (ft) below ground surface (bgs)
- Sand, generally medium- to coarse-grained, with some gravel horizons, which generally coarsens with depth from about 15 to 100 ft bgs

The unconsolidated alluvial sand and gravel deposits are underlain by bedrock consisting of Pennsylvanian sandstones, shales, limestones, and coal of the Monongahela group (Arcadis 2016). All wells within the corrective action monitoring network are screened in the unconsolidated sand and gravel aquifer, except MW-1805 and MW-1922D, which are both screened in the underlying Monongahela group, as shown in the boring logs as a combination of sandstone, coal, and shale (**Attachment A**).

### 2.3 Regional Hydrogeology

Five groundwater pumping wells were installed at the site in 2008 and are currently active (**Figure 1**). The groundwater pumping wells are screened within the unconsolidated sand and gravel aquifer unit. Wells West 1 and East 1 provide cooling water and process water for the site and have pumping capacities of approximately 930 to 950 gallons per minute (gpm) and 550 to 575 gpm, respectively. Historically, wells 4, 5, and 6 are pumped at lower flow rates than West 1 and East 1 and are operated on an intermittent, as-needed basis.

The groundwater flow direction at the site is influenced by operation of the pumping wells. Extraction of groundwater from the production wells depresses groundwater elevations near the wells in the unconsolidated sand and gravel unit and affects the groundwater flow patterns in the vicinity of the BAPs. A groundwater modeling study, included as Appendix C of the Groundwater Monitoring Well Network Evaluation (Arcadis 2016), was completed to better understand the effect of the pumping wells on groundwater flow under normal conditions (i.e., consistent pumping at wells West 1 and East 1). A potentiometric map generated using these simulated conditions shows that flow is naturally directed toward the Ohio River but is influenced by a cone of depression resulting from operation of the pumping wells (**Attachment B**). Groundwater migrating from the downgradient, northeast side of the BAPs would be predicted to migrate beneath the former Sporn fly ash pond and toward West 1 and East 1.

### 3. ALTERNATIVE SOURCE DEMONSTRATION

The proposed alternative sources for arsenic and molybdenum are described below.

#### 3.1 Proposed Alternative Source

Described below are the ASD evaluation methods, the proposed alternative source of arsenic at MW-1805 and MW-1922D, the proposed alternative source of molybdenum at MW-1921, and the future groundwater sampling requirements.

##### 3.1.1 Arsenic

An initial review of site geochemistry, site historical data, and laboratory quality assurance / quality control (QA/QC) data did not identify alternative sources for arsenic due to Type I (sampling), Type II (laboratory), or Type III (statistical evaluation) issues. A preliminary review of site geochemistry did not identify any Type V (anthropogenic) causes. Therefore, an evaluation was conducted to assess whether the arsenic SSLs can be attributed to natural variation, which is a Type IV cause.

###### 3.1.1.1 Evidence: Arsenic Distribution

If concentrations of arsenic were higher at the BAPs than in groundwater, it would indicate that the BAPs could be the source. However, the BAP liquids contain lower concentrations of arsenic than the groundwater at the wells of interest, making the BAPs an unlikely source. Reported concentrations of arsenic in surface water samples collected from the pond in 2016 and 2021 were lower than any concentrations reported in groundwater at MW-1805 and MW-1922D (**Table 1**). In fact, the average BAP arsenic concentrations are two orders of magnitude lower than the average concentration observed at MW-1922D and approximately one order of magnitude lower than the average concentration observed at MW-1805.

Downgradient sand and gravel aquifer wells MW-1604S, MW-1604D, and MW-1922S are located in the immediate vicinity of bedrock wells MW-1805 and MW-1922D (**Figure 1**). Reported arsenic concentrations in groundwater from these locations are consistently lower than they are in MW-1805 and MW-1922D groundwater (**Figure 2**). If elevated arsenic concentrations were a result of a release from the BAPs, we would expect arsenic concentrations to be higher at wells screened in the more permeable sand and gravel lithology below the BAPs than in the underlying bedrock (**Figure 3**). This assumption is supported by downward vertical gradients that are periodically observed from the sand and gravel aquifer into the underlying bedrock, which could permit groundwater flow from the unconsolidated material into the bedrock under downward gradient conditions (**Table 2**). The lack of elevated arsenic in shallow sand and gravel aquifer monitoring wells suggests that an alternative source of arsenic is impacting deeper bedrock wells MW-1805 and MW-1922D.

###### 3.1.1.2 Evidence: Bedrock Sampling and Analyses

Analyses of bedrock samples from MW-1805 and MW-1922D indicate that arsenic is present in the solid phase of the screened interval of both wells. Mineralogical analyses of these samples revealed the presence of a suite of minerals and compounds known to be associated with arsenic. These aquifer solid components constitute an alternative natural source of arsenic to groundwater,

because groundwater must pass through and interact with these aquifer solids before entering the monitoring wells of interest.

Bedrock samples were collected on December 21, 2022, from cores collected during the prior installation of MW-1805 and MW-1922D. Four samples were collected from the screened interval of MW-1805 and two samples were collected from the screened interval of MW-1922D. The sample depths and associated lithologies, as documented in the boring logs (**Attachment A**) for each bedrock sample, are provided on **Table 3**. The samples were submitted for analyses of total arsenic; mineralogy analysis via X-ray diffraction (XRD); bulk geochemistry analysis via X-ray fluorescence (XRF); and scanning electron microscopy (SEM) analysis with energy-dispersive X-ray spectroscopy (EDX). The laboratory report for total arsenic analyses is provided as **Attachment C**. The laboratory analytical report for the XRD, XRF, and SEM-EDX analyses is provided as **Attachment D**.

Arsenic was detected in all bedrock samples analyzed, with reported concentrations ranging from 2.9 milligrams of arsenic per kilogram of rock (mg/kg) to 56 mg/kg (**Table 3**). Arsenic concentrations exceeding 50 mg/kg were found to be associated with shale and coal lithologies observed within the screened interval of MW-1805 (122 and 128 ft bgs, respectively). All samples analyzed were collected from rock core taken from the screened interval of both monitoring wells; therefore, groundwater samples from MW-1805 and MW-1922D enter these wells through aquifer material that contains appreciable arsenic concentrations within the solid phase.

Elevated arsenic concentrations in MW-1805 bedrock can be readily attributed to the presence of coal- and iron-bearing minerals that were identified within the bedrock solids via XRD and SEM analyses (**Table 4**). Arsenic is often associated with coal (Yudovich and Ketris 2005). Based on lithologic descriptions (**Attachment A**), coal comprises the amorphous component (84 percentage by weight [wt.%] of the total sample) of the MW-1805 sample collected from 128 ft bgs. Ferrous ( $\text{Fe}^{2+}$ ) iron minerals pyrite and siderite were also observed in MW-1805 samples (**Table 4**). Pyrite is an iron-sulfide mineral known to be commonly associated with arsenic via co-precipitation processes (Brannon and Patrick 1987, Moore et al. 1988, O'Day et al. 2004). Pyrite was detected in every sample collected from MW-1805, at abundances up to 4 wt.% (**Table 4; Figure 4**). Siderite, an iron-carbonate mineral, was reported in three of the four samples collected from MW-1805 (**Table 4; Figure 5**).

A previous ASD completed for arsenic at MW-1805 and MW-1922D proposed iron mineral thermodynamic instability and dissolution as a likely mechanism for elevated aqueous arsenic concentrations (Geosyntec 2022). Ferrous ( $\text{Fe}^{2+}$ ) iron minerals such as sulfides (pyrite) and carbonates (siderite) are capable of sequestering arsenic through sorption and/or co-precipitation (Gross and Low 2013). Dissolution or alteration of these minerals due to changing oxidation-reduction (redox) conditions would trigger dissolution of adsorbed and/or co-precipitated arsenic. This hypothesis is supported by thermodynamic modeling, which indicates that MW-1805 groundwater plots near the stability boundaries between soluble iron and insoluble iron oxide ( $\text{Fe(OH)}_3$ ), siderite, and pyrite (**Figure 6**). XRD and SEM-EDX findings verify the presence of both siderite and pyrite in MW-1805 samples, supporting the conclusion that dynamic equilibrium conditions exist within MW-1805 groundwater.

Under the dynamic equilibrium conditions described above, arsenic concentrations in MW-1805 groundwater would be expected to correlate strongly with dissolved iron concentrations because

arsenic would mobilize from iron minerals as they dissolve or alter. Total arsenic concentrations and dissolved iron concentrations fluctuate in a similar manner, suggesting that this arsenic-iron relationship occurs at MW-1805 (**Figure 7**), and the correlation between these parameters is very strong ( $R^2$  value of 0.91) (**Figure 8**). Further, the arsenic concentration changes correlate strongly with changes in oxidation-reduction potential (ORP) (**Figure 9**). These relationships indicate that aqueous arsenic concentrations at MW-1805 are strongly linked to redox changes, and they support the proposed mechanism of arsenic association with iron minerals and subsequent mobilization of arsenic as iron minerals dissolve or alter.

While coal, pyrite, and siderite were not detected in the XRD or SEM analyses for MW-1922D, arsenic in MW-1922D bedrock is attributable to the presence of mica/clay minerals and iron oxyhydroxide minerals.

A potential source of arsenic to groundwater within the screened interval of MW-1922D is the chemical weathering of mica grains to clay minerals. Previous studies have shown that mica separates from sandstone samples can contain up to five times the amount of solid-phase arsenic as the remainder of the bulk sample (Dowling et al. 2002). Chemical weathering of mica grains to secondary clay mineral cements (a common diagenetic reaction in sandstones) would result in dissolution of arsenic from the crystal structure of micas and/or from sorption sites on mica surfaces.

These mechanisms have been invoked as processes responsible for high concentrations of aqueous arsenic sources in some aquifers (Dowling et al. 2002, Raju 2022). SEM imaging of the 104.5 ft bgs sample revealed the presence of mica grains that appear to be frayed and experiencing exfoliation along layer planes (**Figure 10**), two common indicators of chemical weathering in micas.

Further support of chemically weathered mica is provided by the presence of secondary clay minerals (kaolinite), which are abundant throughout the sample and appear to be precipitating immediately adjacent to mica grains (**Figure 10**). Kaolinite is a known weathering product of mica and frequently precipitates immediately adjacent to mica grains (Singh and Gilkes 1991, Robertson and Eggleton 1991).

Another potential source of arsenic in MW-1922D bedrock is iron oxyhydroxide minerals. Iron-oxide and oxyhydroxide minerals hematite and goethite were both detected in the MW-1922D sample collected from 111 ft bgs (**Table 4**). Arsenic association with iron-oxide and oxyhydroxide minerals is well documented (Welch et al. 2000).

### 3.1.2 Molybdenum

An initial review of site geochemistry, site historical data, and laboratory QA/QC data did not identify alternative sources for molybdenum due to Type I (sampling), Type II (laboratory), or Type III (statistical evaluation) issues. A preliminary review of site geochemistry did not identify any Type IV (natural variation) causes. Therefore, an evaluation was conducted to assess whether the molybdenum SSL can be attributed to an anthropogenic alternative source, which is a Type V cause.

### **3.1.2.1 Evidence: Limited Molybdenum in the BAPs**

If concentrations of molybdenum were higher at the BAP than in groundwater at MW-1921, it would indicate that the BAP could be the source. However, the BAP surface waters contain lower concentrations of molybdenum than groundwater does at the well of interest, making the BAP an unlikely source. Surface water samples collected from both BAPs in 2016 and 2021 contained lower concentrations of molybdenum than all samples collected from MW-1921 (**Table 5**).

### **3.1.2.2 Evidence: Molybdenum Distribution**

MW-1921 had the highest reported molybdenum concentration of any well during the November 2022 groundwater sampling event, including the groundwater monitoring network wells located upgradient of MW-1921 and immediately downgradient of BAP East (**Figure 11**). MW-1921 is located approximately 2,000 ft downgradient of the waste boundary of BAP East.

These results are consistent with prior sampling events (**Figure 12**). If the molybdenum exceedance at MW-1921 were a result of a release from the BAPs, elevated concentrations would be expected at wells immediately downgradient of the waste boundary, between the BAP East and MW-1921. However, groundwater monitoring network wells located immediately downgradient of the BAPs do not display elevated concentrations and have never had SSLs of molybdenum (Geosyntec 2023).

Groundwater on the northeast side of the BAPs is predicted to migrate beneath the former Sporn fly ash pond and toward production wells West 1 and East 1 during regular operational conditions (**Attachment B**). The difference in molybdenum concentrations between monitoring wells at the immediate downgradient waste boundary of the BAPs (MW-1605S/D, MW-1606S/D, and MW-1607S/D) and further downgradient well MW-1921 suggests that the former Sporn fly ash pond is the alternative source of molybdenum to groundwater at MW-1921.

To test this hypothesis, a statistical evaluation (**Attachment E**) was completed that compared molybdenum concentrations at MW-1921, located downgradient of the Sporn fly ash pond, to molybdenum concentrations at wells upgradient of the Sporn fly ash ponds and downgradient of the BAPs (MW-1605S/D, MW-1606S/D, and MW-1607S/D) (**Figure 11**). This statistical evaluation included monitoring results through the November 2022 sampling event. Molybdenum results from wells immediately downgradient of the BAPs (MW-1605S/D, MW-1606S/D, and MW-1607S/D) were pooled to generate a UTL of 101.7 micrograms per liter ( $\mu\text{g/L}$ ), which is representative of groundwater conditions immediately downgradient of the Mountaineer BAPs and upgradient of the Sporn fly ash pond. The calculated LCL for MW-1921 was 420  $\mu\text{g/L}$ , which exceeded the calculated molybdenum UTL for wells downgradient of the Mountaineer BAPs (**Figure 13**). Because the calculated LCL for MW-1921 (downgradient of the Sporn fly ash pond) exceeded the UTL calculated from wells immediately downgradient of the Mountaineer BAPs and upgradient of the Sporn fly ash pond, an SSL would be triggered in a hypothetical system where MW-1921 is a downgradient monitoring well for the Sporn fly ash pond. This statistically significant result provides further evidence that the former Sporn fly ash pond is the alternative source of molybdenum to groundwater at MW-1921.

### **3.2 Sampling Requirements**

This ASD indicates that the arsenic and molybdenum SSLs are not due to a release from the Mountaineer BAPs. Therefore, a corrective measures assessment for arsenic and molybdenum is not necessary.

The former Sporn fly ash pond has impacted groundwater samples from MW-1921, and the samples from MW-1921 cannot be used to assess the effectiveness of the remedy for lithium from the BAPs, as required in 40 CFR 257.98(a)(1)(ii). Therefore, MW-1921, which was identified as a nature-and-extent well in the Corrective Action Monitoring Plan (Sanborn Head 2022), should be removed from the corrective action groundwater monitoring network.

## 4. CONCLUSIONS AND RECOMMENDATIONS

The preceding information serves as the ASD prepared in accordance with 40 CFR 257.95(g)(3)(ii) and supports the position that the SSLs for arsenic and molybdenum identified during corrective action monitoring in November 2022 were not due to a release from the BAPs. Instead, the following conclusions are made:

- The arsenic SSLs should be attributed to natural variation in the underlying geology.
- The molybdenum SSL should be attributed to impacts to groundwater from an adjacent anthropogenic source.

Therefore, no further action for arsenic and molybdenum is warranted and the BAPs will continue corrective action groundwater monitoring due to the presence of elevated lithium concentrations, in accordance with 40 CFR 257.98(a)(1). Certification of this ASD by a qualified professional engineer is provided in **Attachment F**.

- CCR Network Monitoring Wells
  - Nature and Extent Monitoring Wells
  - Piezometer
  - AEP-Owned Pumping Well
  - Groundwater Elevation Contour
  - Approximate Groundwater Flow Direction

**Notes**

- Monitoring well coordinates and water level data (collected on October 31, 2022) provided by AEP.
- Site features based on information available in Ash Pond System-CCR Groundwater Monitoring Well Network Evaluation (Arcadis 2016) provided by AEP.
- Groundwater elevation units are feet above mean sea level.
- Only monitoring wells were used to generate groundwater contours. Water elevations were not collected for the pumping wells.
- No groundwater was present at MW-1928 and MW-112 during the October 2022 sampling event.
- Normal lower pool elevation of the Ohio River at Racine Lock and Dam is 539.5 ft amsl (USACE).
- Intermittent use of AEP-owned pumping wells for plant activities impact water levels in the vicinity. In general, shallow groundwater beneath the plant flows northeast toward the Ohio River.
- CCR: Coal combustion residuals
- USACE: United States Army Core of Engineers

**Notes:**

1. Scale is approximate; all units of length are in feet.
2. Vertical exaggeration is 5x.
3. This section was created using widely spaced boreholes; thus, all interpretation away from borehole locations should be considered an approximate representation.
4. Groundwater arsenic concentration values are from samples collected in November of 2022.
5. Ash pond extents and depths are approximate and projected from out of the plane of section. Extents do not represent constructed dimensions.
6. Pond water results are averaged from samples collected in 2016 and 2021.

23009-05E 500X

Notes: Sample was collected from a depth of 104.5 feet below ground surface from MW-1922D core. Scanning electron microscope (SEM) instrument settings are indicated at the bottom of each micrograph. Micaceous shale is indicated by the orange 'M' and orange arrow. Partial exfoliation of the mica sheets as well as secondary clay mineral formation immediately adjacent to mica sheets suggests chemical weathering of mica to clays. The bottom micrograph shows prevalent secondary clay mineral formation (kaolinite) within open pore space.

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Allison Kreinberg  
Geosyntec Consultants Inc  
500 West Wilson Bridge Road  
Suite 250  
Worthington, Ohio 43085

Generated 4/18/2023 12:16:08 PM

## JOB DESCRIPTION

MTR BAP

## JOB NUMBER

240-183413-1

# Eurofins Canton

## Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

## Qualifiers

### Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

## Comments

Run Total Metals - no leaching - per client email request.

## Receipt

The samples were received on 4/12/2023 9:45 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.6° C.

## Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Organic Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Method Summary

Client: Geosyntec Consultants Inc  
Project/Site: MTR BAP

## **CONDITIONS AND QUALIFICATIONS**

*Mineralogy, Inc. will endeavor to provide accurate and reliable laboratory measurements of the samples provided by the client. The results of any x-ray diffraction, petrographic or core analysis test are necessarily influenced by the condition and selection of the samples to be analyzed. It should be recognized that geological samples are commonly heterogeneous and lack uniform properties. Mineralogical, geochemical and/or petrographic data obtained for a specific sample provides compositional data pertinent to that specific sampling location. Such "site-specific data" may fail to provide adequate characterization of the range of compositional variability possible within a given project area, thus the "projection" of these laboratory findings and values to adjoining, "untested" areas of the formation or project area is inherently risky, and exceeds the scope of the laboratory work request. Hence, Mineralogy, Inc. shall not assume any liability risk or responsibility for any loss or potential failure associated with the application of "site or sample-specific laboratory data" to "untested" areas of the formation or project area. Unless otherwise directed, the samples selected for analysis will be chosen to reflect a visually representative portion of the bulk sample submitted for analysis. Where provided, the interpretation of x-ray diffraction, petrographic or core analysis results constitutes the best geological judgment of Mineralogy, Inc., and is subject to the sampling limitations described above, and the detection limits inherent to semi-quantitative and/or qualitative mineralogical and microscopic analysis. Mineralogy, Inc. assumes no responsibility nor offers any guarantee of the productivity, suitability or performance of any oil or gas well, hydrocarbon recovery process, dimension stone, and/or ore material based upon the data or conclusions presented in this report.*

*This report is to only be replicated in its entirety.*

**Sample Retention:** Samples will be stored for a period of 30 days and thereafter discarded. If additional sample storage time and/or return shipping is required, appropriate charges will be billed to the client.

**Geosyntec Consultants**  
Mountaineer | New Haven, WV

**MW-1805-122**  
MI#23009-01 - SEM

**Summary:** This core sample is characterized as a medium gray (N5), compact parallel-bedded, non-porous, micaceous, silty shale. The shale mineralogy is dominated by clay minerals and mica which together account for ~68% of the sample mass. The clay mineral suite is enriched with respect to illite/mica (~39%), chlorite (~16%), and kaolinite (~11%), coupled with relatively minor amounts of mixed-layered illite/smectite (~2%). The detrital silt and sand grains are moderately to poorly sorted, sub-rounded, and matrix-supported. The detrital grain assemblage includes quartz (~24%) plagioclase feldspar (~5%) and minor amounts of k-feldspar (~1%). Minor amounts of siderite (~2%) are also present in the silty shale. SEM Figures 1A through 1C provide backscatter & scanning electron views of a typical bedding plane surface. Traces of microporosity are locally present flanking the silt and sand grains. Figures 1D through 1F provide images of the shale fabric in cross section. The SEM images reveal the presence of scattered, lens-shaped macropores & micropores, preserved and sheltered by the propping effect of randomly distributed silt and sand grains.

**MW-1805-124.5**  
MI#23009-02 - SEM

**Summary:** This core interval is comprised of light gray (N8), cross-bedded, medium-grained, well sorted, quartz-cemented, sub-arkosic sandstone. The sandstone fabric is well-cemented & moderately porous, with scattered intergranular macropores. Pore-filling authigenic kaolinite clay is scattered throughout the sandstone framework, occurring as vermicular stacks of clay platelets (see Figures 2E & 2F). The quartz-rich framework is well-cemented with authigenic quartz overgrowths. Total macroporosity for this sandstone is estimated to comprise ~ 6-9% of the sandstone bulk volume. The mineralogy of the sandstone is dominated by quartz (73%), feldspar [including plagioclase (7%) and k-feldspar (8%)], kaolinite (7.5%), illite / mica (4%), and scattered traces (i.e., <0.5%) of siderite, calcite, and pyrite.

**MW-1805-128**  
MI#23009-03 - SEM

**Summary:** A compact, parallel bedded seam of coal is present at core depth 128'. Based on the x-ray diffraction pattern collected for this material, the organic matter is estimated to exhibit a maximum rank of medium to low volatile bituminous coal. The mineralogical analysis indicates that thermally altered organic matter (coal) comprises ~84% of the sample mass. The inorganic mineral fraction includes a mixture of clay matrix minerals (~8%), quartz (~4%), and pyrite (~4%). The clay mineral fraction is comprised of kaolinite coupled with minor amounts of illite & mixed-layered illite/smectite. The pyrite & clay minerals are typically present as authigenic minerals that have crystallized within fractures and dissolution voids contained within the coal.

**MW-1805-130.5**  
MI#23009-04 - SEM

**Summary:** This core interval is comprised of medium light gray (N6), compact, parallel-bedded, non-porous, micaceous, silty shale / clay-rich siltstone. The silt-rich grain fraction is sub-arkosic, moderately sorted, and sub-rounded to sub-angular. The relative proportion of silt & clay matrix / mica is variable between individual bedding layers, with some interbeds characterized as clay-rich (grain-supported) siltstones. Minute mica laths are abundant throughout the sedimentary fabric. Based on the XRD mineralogical analysis, clay minerals account for ~ 58% of the mineral mass. The clay mineral suite includes illite / mica (~33%), chlorite (~14%), kaolinite (~10%), and mixed-layered illite/smectite (~1%). Silt grain materials are dominated by quartz (~32%) and feldspar [including plagioclase (~7%) and k-feldspar (~1%)]. Minor amounts of siderite cement (~1.5%) and pyrite (~0.5%) are also present, distributed as minute (~1-5 um diameter) crystals dispersed throughout the clay-rich groundmass. Total void space is estimated to account for <2% of the bulk volume. The sedimentary fabric includes small amounts of residual macroporosity & microporosity. The sheltered interparticle voids are locally preserved as minute, lens-shaped voids that appear isolated due to the pervasive distributions of detrital clay matrix.

MI#23009-05 - SEM

**Summary:** This core sample is characterized as a cross-bedded, medium-grained, well-sorted, quartz-cemented, moderately porous, sub-arkosic sandstone. The framework is compact and exhibits common point-to-point & elongated intergranular contacts. Rims of syntaxial quartz overgrowth cement are locally intergrown along contacts shared by adjoining quartz grains. Scattered feldspar grains exhibit indications of intra-particle corrosion and localized replacement with authigenic kaolinite. The mineralogy of the sandstone is comprised of quartz (~86%), plagioclase feldspar (~4%), k-feldspar (~1%), kaolinite (~6%), illite / mica (~2.5%), and traces of calcite (0.5%), and mixed-layered illite/smectite (<0.5%) [see Table I]. Macroporosity is visually estimated to comprise ~ 8-10% of the sandstone bulk volume.

MI#23009-06 - SEM

**Summary:** This core sample is similar to the core interval @ 104.5' (MI#23009-05) & is characterized as a cross-bedded, medium-grained, moderately-sorted, quartz-cemented, moderately porous, sub-arkosic sandstone. The framework is compact and exhibits common point-to-point & elongated intergranular contacts. Rims of syntaxial quartz overgrowth cement are locally inter grown along contacts shared by adjoining quartz grains. Scattered feldspar grains exhibit indications of intra-particle corrosion and localized replacement with authigenic kaolinite. The mineralogy of the sandstone is comprised of quartz (~85%), plagioclase feldspar (~3%), k-feldspar (~2%), kaolinite (~6%), illite / mica (~3%), and traces of goethite (0.5%), hematite (~0.5%) and chlorite (<0.5%) [seeTable I]. Macroporosity is visually estimated to comprise ~ 5-7% of the sandstone bulk volume.

## 1. INTRODUCTION AND SUMMARY

This Alternative Source Demonstration (ASD) report has been prepared to address statistically significant levels (SSLs) of arsenic in the groundwater monitoring network at the Mountaineer Power Plant's bottom ash ponds (BAPs) in New Haven, West Virginia.

This ASD follows the first semiannual corrective action monitoring event of 2023, which was conducted in May at the BAPs in accordance with Title 40, Section 257.98(a)(1) of the Code of Federal Regulations (CFR). The monitoring data were submitted to Groundwater Stats Consulting, LLC for statistical analysis. A confidence interval was constructed for each Appendix IV parameter at each compliance well, nature-and-extent well, and sentinel well. An SSL was attributed to a parameter if its lower confidence limit (LCL) exceeded the groundwater protection standard (GWPS) (i.e., if the entire confidence interval exceeded the GWPS).

The GWPS was established as whichever was greater of: (1) the background concentration (determined via calculation of an upper tolerance limit [UTL]), or (2) the maximum contaminant level (MCL) and risk-based level specified in 40 CFR 257.95(h)(2). The following SSLs were identified at the Mountaineer BAPs (Geosyntec 2023a):

- Arsenic at MW-1805 and MW-1922D, both of which are screened in the underlying Monongahela Formation bedrock
- Lithium at MW-1605D, MW-1605S, MW-1606D, MW-1606S, MW-1607D, MW-1607S, MW-1922S, MW-1923, MW-1924, and MW-1925, all of which are screened in the sand and gravel aquifer

Corrective measures are currently being completed at the BAPs for identified lithium SSLs. Source removal and hydraulic containment was selected as the remedy for groundwater impacts of lithium associated with the BAPs (Sanborn Head 2021). Therefore, alternative sources were not evaluated for lithium in this demonstration. While a molybdenum SSL was identified at nature and extent monitoring well MW-1921, this location was evaluated to support corrective action monitoring and alternative sources were not evaluated for molybdenum in this demonstration.

### 1.1 CCR Rule Requirements

In accordance with the United States Environmental Protection Agency (USEPA) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments, 40 CFR 257.95(g)(3)(ii) states the following:

The owner or operator may demonstrate that a source other than the CCR unit caused the contamination, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. Any demonstration must be supported by a report that includes the factual or evidentiary basis for any conclusions and must be certified by a qualified professional engineer.

Pursuant to 40 CFR 257.95(g)(3)(ii), Geosyntec Consultants, Inc. (Geosyntec) has prepared this ASD report to document whether the SSLs identified for arsenic are from a source other than the BAPs.

## 1.2 Demonstration of Alternative Sources

An evaluation was completed to assess possible alternative sources of arsenic to which identified SSLs could be attributed. Alternative sources were identified among the following five types:

- ASD Type I: Sampling Causes
- ASD Type II: Laboratory Causes
- ASD Type III: Statistical Evaluation Causes
- ASD Type IV: Natural Variation
- ASD Type V: Alternative Sources

A demonstration was conducted to assess whether the SSLs of arsenic at MW-1805 and MW-1922D were based on Type IV (Natural Variation) causes and not caused by a release from the BAPs.

## 2. SUMMARY OF SITE CONDITIONS

Brief descriptions of the site construction, geology, and hydrogeology are provided below.

### 2.1 Site Construction and Location

The BAP CCR unit consisted of two ponds of roughly equal size (BAP East and BAP West) with a combined surface area of approximately 28 acres. The BAP West had a normal pool area of 14.1 acres and the BAP East had a normal pool area of 13.9 acres (Arcadis 2016). The BAPs were constructed between 1978 and 1980 with a 3-foot-thick clay liner. Removal of CCR and potentially impacted underlying soil from the BAPs to support closure was completed in May 2023. The selected groundwater remedy was initiated in 2023.

Several non-CCR-regulated ponds are located immediately south of the BAPs and, together with the BAPs, form the Site Pond Complex (**Figure 1**). An electrical substation is located northwest of the BAPs. A former Philip Sporn (Sporn) bituminous coal mining facility is located to the west of the BAPs. A 60-acre fly ash pond associated with the former Sporn Power Plant is located to the northeast of the BAPs (**Figure 1**).

### 2.2 Regional Geology

Beneath the clay liner, the former BAPs are immediately underlain by Quaternary alluvial deposits consisting of clay, silt, sand, and gravel. The unconsolidated alluvial deposits consist of the following two units (Sanborn Head 2020):

- Alternating horizons of clay and clayey silt, with thicknesses ranging from 0 to 30 feet (ft) below ground surface (bgs)
- Sand, generally medium- to coarse-grained, with some gravel horizons, which generally coarsens with depth from about 15 to 100 ft bgs

The unconsolidated alluvial sand and gravel deposits are underlain by bedrock consisting of Pennsylvanian sandstones, shales, limestones, and coal of the Monongahela group (Arcadis 2016). The wells within the corrective action monitoring network are screened in the unconsolidated sand and gravel aquifer, except MW-1805 and MW-1922D, which are both screened in the underlying Monongahela group, which is shown in the boring logs as a combination of sandstone, coal, and shale (**Attachment A**).

### 2.3 Regional Hydrogeology

Five groundwater pumping wells were installed at the site in 2008 and are currently active (**Figure 1**). The groundwater pumping wells are screened within the unconsolidated sand and gravel aquifer unit. Wells West 1 and East 1 provide cooling water and process water for the site and have pumping capacities of approximately 930 to 950 gallons per minute (gpm) and 550 to 575 gpm, respectively. Historically, wells 4, 5, and 6 are pumped at lower flow rates than West 1 and East 1 and are operated on an intermittent, as-needed basis.

The groundwater flow direction at the site is influenced by operation of the pumping wells. Extraction of groundwater from the production wells depresses groundwater elevations near the wells in the unconsolidated sand and gravel unit and affects the groundwater flow patterns in the vicinity of the BAPs. A groundwater modeling study, included as Appendix C of the Groundwater

Monitoring Well Network Evaluation (Arcadis 2016), was completed to better understand the effect of the pumping wells on groundwater flow under normal conditions (i.e., consistent pumping at wells West 1 and East 1). A potentiometric map generated using these simulated conditions shows that flow is naturally directed toward the Ohio River but is influenced by a cone of depression resulting from operation of the pumping wells (**Attachment B**).

### 3. ALTERNATIVE SOURCE DEMONSTRATION

The proposed alternative sources for arsenic are described below.

#### 3.1 Proposed Alternative Source

Described below are the ASD evaluation methods, the proposed alternative source of arsenic at MW-1805 and MW-1922D, and the future groundwater sampling requirements.

An initial review of site geochemistry, site historical data, and laboratory quality assurance / quality control (QA/QC) data did not identify alternative sources for arsenic due to Type I (sampling), Type II (laboratory), or Type III (statistical evaluation) issues. A preliminary review of site geochemistry did not identify any Type V (anthropogenic) causes. Therefore, an evaluation was conducted to assess whether the arsenic SSLs can be attributed to natural variation, which is a Type IV cause.

##### 3.1.1 Evidence: Arsenic Distribution

If concentrations of arsenic were higher at the former BAPs than in the wells of interest, it would indicate that the BAPs could be the source. However, the BAP liquids contain lower concentrations of arsenic than the groundwater at the wells of interest, making the former BAPs an unlikely source. Reported concentrations of arsenic in surface water samples collected from the pond in 2016 and 2021 were lower than any concentrations reported in groundwater at MW-1805 and MW-1922D (**Table 1**). In fact, the average BAP arsenic concentrations are two orders of magnitude lower than the average concentration observed at MW-1922D and approximately one order of magnitude lower than the average concentration observed at MW-1805. These observed arsenic distributions indicate that a source other than the BAPs is responsible for the observed concentrations at the wells of interest.

Downgradient sand and gravel aquifer wells MW-1604S, MW-1604D, and MW-1922S are located in the immediate vicinity of bedrock wells MW-1805 and MW-1922D (**Figure 1**). Reported arsenic concentrations in groundwater from these locations are consistently lower than they are in MW-1805 and MW-1922D groundwater (**Figure 2**). If elevated arsenic concentrations were a result of a release from the BAPs, we would expect arsenic concentrations to be higher at wells screened in the more permeable sand and gravel lithology below the BAPs than in the underlying bedrock (**Figure 3**). This assumption is supported by downward vertical gradients that are periodically observed from the sand and gravel aquifer into the underlying bedrock, which could permit groundwater flow from the unconsolidated material into the bedrock under downward gradient conditions (**Table 2**). The lack of elevated arsenic in shallow sand and gravel aquifer monitoring wells suggests that an alternative source of arsenic is impacting deeper bedrock wells MW-1805 and MW-1922D.

##### 3.1.2 Evidence: Bedrock Sampling and Analyses

Analyses of bedrock samples from MW-1805 and MW-1922D indicate that arsenic is present in the solid phase of the screened interval of both wells. Mineralogical analyses of these samples revealed the presence of a suite of minerals known to be associated with arsenic. These aquifer materials represent an alternative natural source of arsenic to groundwater, because groundwater must interact with these aquifer solids before entering the monitoring wells of interest.

Bedrock samples were collected on December 21, 2022, from cores collected during the prior installation of MW-1805 and MW-1922D. Four samples were collected from the screened interval of MW-1805 and two samples were collected from the screened interval of MW-1922D. The sample depths and associated lithologies, as documented in the boring logs (**Attachment A**) for each bedrock sample, are provided on **Table 3**. The samples were submitted for analyses of total arsenic; mineralogy analysis via X-ray diffraction (XRD); bulk geochemistry analysis via X-ray fluorescence (XRF); and scanning electron microscopy (SEM) analysis with energy-dispersive X-ray spectroscopy (EDX). The laboratory report for total arsenic analyses is provided as **Attachment C**. The laboratory analytical report for the XRD, XRF, and SEM-EDX analyses is provided as **Attachment D**.

Arsenic was detected in all bedrock samples analyzed, with reported concentrations ranging from 2.9 milligrams of arsenic per kilogram of rock (mg/kg) to 56 mg/kg (**Table 3**). Arsenic concentrations exceeding 50 mg/kg were found to be associated with shale and coal lithologies observed within the screened interval of MW-1805 (122 and 128 ft bgs, respectively). All samples analyzed were collected from rock core taken from the screened interval of both monitoring wells; therefore, groundwater samples from MW-1805 and MW-1922D enter these wells through aquifer material that contains appreciable arsenic concentrations within the solid phase.

Elevated arsenic concentrations in MW-1805 bedrock is attributed to the presence of coal- and iron-bearing minerals that were identified within the bedrock solids via XRD and SEM analyses (**Table 4**). Arsenic is often associated with coal (Yudovich and Ketrus 2005). Based on lithologic descriptions (**Attachment A**), coal comprises the amorphous component (84 percentage by weight [wt.-%] of the total sample) of the MW-1805 sample collected from 128 ft bgs. Ferrous ( $\text{Fe}^{2+}$ ) iron minerals pyrite and siderite were also observed in MW-1805 samples (**Table 4**). Pyrite is an iron-sulfide mineral known to be commonly associated with arsenic via co-precipitation processes (Brannon and Patrick 1987, Moore et al. 1988, O'Day et al. 2004). Pyrite was detected in every sample collected from MW-1805, at abundances up to 4 wt.% (**Table 4; Figure 4**). Siderite, an iron-carbonate mineral, was reported in three of the four samples collected from MW-1805 (**Table 4; Figure 5**).

Previous ASDs completed for arsenic at MW-1805 and MW-1922D proposed iron mineral thermodynamic instability and dissolution as a likely mechanism for elevated aqueous arsenic concentrations (Geosyntec 2022, Geosyntec 2023b). Ferrous ( $\text{Fe}^{2+}$ ) iron minerals such as sulfides (pyrite) and carbonates (siderite) are capable of sequestering arsenic through sorption and/or co-precipitation (Gross and Low 2013). Dissolution or alteration of these minerals due to changing oxidation-reduction (redox) conditions would trigger dissolution of adsorbed and/or co-precipitated arsenic. This hypothesis is supported by thermodynamic modeling, which indicates that MW-1805 groundwater typically plots near the stability boundaries between soluble iron and insoluble iron oxide ( $\text{Fe(OH)}_3$ ), siderite, and pyrite (**Figure 6**). XRD and SEM-EDX findings verify the presence of both siderite and pyrite in MW-1805 samples, supporting the conclusion that dynamic equilibrium conditions exist within MW-1805 groundwater.

Under the dynamic equilibrium conditions described above, arsenic concentrations in MW-1805 groundwater would be expected to correlate strongly with dissolved iron concentrations because arsenic would mobilize from iron minerals as they dissolve or alter. Total arsenic concentrations and dissolved iron concentrations fluctuate in a similar manner, suggesting that this arsenic-iron relationship occurs at MW-1805 (**Figure 7**), and the correlation between these parameters is very

strong ( $R^2$  value of 0.93) (**Figure 8**). Further, the arsenic concentration changes correlate strongly with changes in oxidation-reduction potential (ORP) (**Figure 9**). These relationships indicate that aqueous arsenic concentrations at MW-1805 are strongly linked to redox changes, and they support the proposed mechanism of arsenic association with iron minerals and subsequent mobilization of arsenic as iron minerals dissolve or alter.

While coal, pyrite, and siderite were not detected in the XRD or SEM analyses for MW-1922D, arsenic in MW-1922D bedrock is attributable to the presence of mica/clay minerals and iron oxyhydroxide minerals.

A potential source of arsenic to groundwater within the screened interval of MW-1922D is the chemical weathering of mica grains to clay minerals. Previous studies have shown that mica separates from sandstone samples can contain up to five times the amount of solid-phase arsenic as the remainder of the bulk sample (Dowling et al. 2002). Chemical weathering of mica grains to secondary clay mineral cements (a common diagenetic reaction in sandstones) would result in dissolution of arsenic from the crystal structure of micas and/or from sorption sites on mica surfaces.

These mechanisms have been invoked as processes responsible for high concentrations of aqueous arsenic sources in some aquifers (Dowling et al. 2002, Raju 2022). SEM imaging of the 104.5 ft bgs sample from MW-1922D revealed the presence of mica grains that appear to be frayed and experiencing exfoliation along layer planes (**Figure 10**), two common indicators of chemical weathering in micas.

Further support of chemically weathered mica is provided by the presence of secondary clay minerals (kaolinite), which are abundant throughout the sample and appear to be precipitating immediately adjacent to mica grains (**Figure 10**). Kaolinite is a known weathering product of mica and frequently precipitates immediately adjacent to mica grains (Singh and Gilkes 1991, Robertson and Eggleton 1991).

Another potential source of arsenic in MW-1922D bedrock is iron oxyhydroxide minerals. Iron-oxide and oxyhydroxide minerals hematite and goethite were both detected in the MW-1922D sample collected from 111 ft bgs (**Table 4**). Arsenic association with iron-oxide and oxyhydroxide minerals is well documented (Welch et al. 2000).

### 3.2 Sampling Requirements

This ASD indicates that the arsenic SSLs are not due to a release from the Mountaineer BAPs. Therefore, a corrective measures assessment for arsenic is not necessary. Groundwater monitoring at the unit will continue in accordance with the Corrective Action Monitoring Plan (Sanborn Head 2022).

#### **4. CONCLUSIONS AND RECOMMENDATIONS**

The preceding information serves as the ASD prepared in accordance with 40 CFR 257.95(g)(3)(ii) and supports the position that the SSLs for arsenic identified during corrective action monitoring in May 2023 were not due to a release from the BAPs. Instead, the arsenic SSLs should be attributed to natural variation in the underlying geology. Therefore, no further action for arsenic is warranted and the BAPs will continue corrective action groundwater monitoring due to the presence of elevated lithium concentrations, in accordance with 40 CFR 257.98(a)(1). Certification of this ASD by a qualified professional engineer is provided in **Attachment E**.

Length to MW-1922S Screen	51.92	29.95	-						

Notes:

Anomalous groundwater elevations were excluded from calculations - MW-1922D and MW-1922S from September 2019, MW-1805 from May 2021. Groundwater elevation data was generated by Arcadis and provided to Geosyntec.

**Table 3 - Bedrock Sampling Details and Arsenic Concentrations  
Mountaineer Bottom Ash Ponds**

*Geosyntec Consultants*

Monitoring Well	Depth of Well	Screened Interval	Sample Depth	Arsenic (mg/Kg)	Geologic Material Sampled
MW-1805	133.5	123.5-133.5	122	55 B	Dark grey laminated silty clay shale
			124.5	4.6 B	Light grey sandstone
			128	56 B	Black coal with pyritic clay-rich zones
			130.5	2.9 B	Dark grey fractured silty clay shale
MW-1922D	113.5	103.5-113.5	104.5	4.5 B	Grey sandstone
			111	5.2 B	Grey sandstone

Notes:

Samples were collected on December 21, 2022 from previously drilled core associated with monitoring well installation

All depths are shown in units of feet below ground surface

Geologic descriptions included in the table were taken from field boring logs and verified during sample collection in December 2022

B: Compound was found in the blank and sample. Method blank detections were less than 10% of the reported sample values and are not expected to affect data quality.

## Notes

- Notes**

  1. Monitoring well coordinates and water level data (collected on May 19, 2023) provided by AEP.
  2. Site features based on information available in Ash Pond System-CCR Groundwater Monitoring Well Network Evaluation (Arcadis 2016) provided by AEP.
  3. Groundwater elevation units are feet above mean sea level.
  4. Only monitoring wells were used to generate groundwater contours. Water elevations were not collected for the pumping wells.
  5. No groundwater was present at MW-1928 and MW-112 during the May 2023 sampling event.
  6. Normal lower pool elevation of the Ohio River at Racine Lock and Dam is 539.5 ft amsl (USACE).
  6. Intermittent use of AEP-owned pumping wells for plant activities impact water levels in the vicinity. In general, shallow groundwater beneath the plant flows northeast toward the Ohio River.

CCR: Coal combustion residuals

**Notes:**

1. Scale is approximate; all units of length are in feet.
2. Vertical exaggeration is 5x.
3. This section was created using widely spaced boreholes; thus, all interpretation away from borehole locations should be considered an approximate representation.
4. Groundwater arsenic concentration values are from samples collected in May of 2023.
5. Ash pond extents and depths are approximate and projected from out of the plane of section. Extents do not represent constructed dimensions.
6. Pond water results are averaged from samples collected in 2016 and 2021.

Depth (ft)	Drill Rate (min/ft)	Sample Information				Stratum		Geologic Description	Remarks
		Sample No.	Depth (ft)	Spoon Blows per 6 in	Pen/Rec (in)	Field Testing Data	Log		
50		S-15	50.5 - 52	3 5 7	18/9	PID: NM		S-15 (50.5 to 52'): Medium dense, brown, fine to coarse SAND, little Silt. Wet.	At S-15 switch to 3 inch split spoon (18 inches long) from 2 inch split spoon (24 inches long) to increase sample volume.
52		S-16	52 - 53.5	1 3 5	18/0	PID: NM		S-16 (52 to 53.5'): No recovery.	
54		S-17	53.5 - 55	1 6 10	18/6	PID: NM		S-17 (53.5 to 55'): Medium dense, brown, fine to coarse SAND, trace Silt. Wet.	
56		S-18	55 - 56.5	2 4 7	18/7	PID: NM		S-18 (55 to 56.5'): Medium dense, grayish brown, fine to coarse SAND, trace Silt. Wet.	
58		S-19	56.5 - 58	1 3 7	18/0	PID: NM		S-19 (56.5 to 58'): No recovery.	
58		S-20	58 - 59	NM	12/18	PID: NM		S-20 (58 to 59'): Brown, fine to coarse SAND, little Silt, trace Gravel. Wet.	S-20 sampled by Shelby tube, no recovery and refusal after 1 foot Then collected with 2 inch split spoon and switch to 2 inch split spoon after S-20.
60		S-21	59 - 60.5	3 8 6	18/14	PID: NM		S-21 (59 to 60.5'): Medium dense, brown, fine to coarse SAND, little Silt, trace Gravel. Wet. Seam black fine to medium SAND at 60 feet.	
62		S-22	60.5 - 62	6 7 11	18/22	PID: NM	FINE TO COARSE SAND	S-22 (60.5 to 62'): Medium dense, brown, fine to coarse SAND, little Silt, trace Gravel. Wet.	
64		S-23	62 - 63.5	2 6 9	18/13	PID: NM		S-23 (62 to 63.5'): Medium dense, brown, fine to coarse SAND, trace Silt, trace Gravel. Wet.	
64		S-24	63.5 - 65	3 5 7	18/12	PID: NM		S-24 (63.5 to 65'): Medium dense, brown, fine to coarse SAND, some Silt. Wet.	
66		S-25	65 - 66.5	3 6 7	18/18	PID: NM		S-25 (65 to 66.5'): Medium dense, brown, fine to medium SAND, little Silt. Wet.	Start introducing Bentonite/water mix due to heaving sands
68		S-26	66.5 - 68	8 11 9	18/18	PID: NM		S-26 (66.5 to 68'): Medium dense, gray/brown, fine to coarse SAND, little Silt, trace Gravel. Wet.	
70		S-27	68 - 69.5	3 8 9	18/14	PID: NM		S-27 (68 to 69.5'): Medium dense, gray, fine to coarse SAND, little Silt, trace Gravel. Wet.	
70		S-28	69.5 - 71	10 11 15	18/15	PID: NM		S-28 (69.5 to 71'): Medium dense, gray, fine to coarse SAND, little Gravel, trace Silt. Wet.	
72		S-29	71 - 72.5	10 13 19	18/11	PID: NM		S-29 (71 to 72.5'): Medium dense, gray, fine to coarse SAND, little Gravel, trace Silt. Wet.	
74		S-30	72.5 - 74	8 12 10	18/11	PID: NM		S-30 (72.5 to 74'): Medium dense, gray, fine to coarse SAND, trace Gravel, trace Silt. Wet.	
74		S-31	74 - 75.5	11 13 14	18/10	PID: NM		S-31 (74 to 75.5'): Medium dense, gray, fine to coarse SAND, little Gravel, trace Silt. Wet.	

SANBORN HEAD

Sanborn, Head &amp; Associates, Inc.

Project: AEP Mountaineer  
 Location: New Haven, WV  
 Project No.: 4345.00

## Log of Boring SB-1805

Ground Elevation: Not Available

Drilling Method: HWT Casing with advancer, 3 1/4" ID HSA, PWL Coring

Sampling Method: 2" O.D and 3" O.D. Split Spoon with automatic hammer; 2" OD Shelby tube; NQ2 5-ft long core barrel

Drilling Company: Terracon Consultants, Inc.

Foreman: N. Francis/K. Fowler

Date Started: 06/18/18

Date Finished: 06/21/18

Logged By: L. Coenthal

Checked By: A. Ashton

<b>Sample Information</b>																			
Depth (ft)	Drill Rate (min/ft)	Sample No.	Depth (ft)	Spoon Blows per 6 in	Pen/Rec (in)	Field Testing Data	Log	Description	Geologic Description								Remarks		
126									SANDSTONE, with very thin to thin black lenses. Sound. REC=88%. RQD=65%.										
128									C-09B (125.3 to 129.3'): Very soft to soft, black, very fine grained, COAL, with thinly spaced horizontal partings, very soft gray very fine grained horizontal Clay-rich zone from 125.5 to 125.8 feet, very thin to thin Clay lenses with Pyrite throughout. Vertical crack with calcite mineralization from 127.6 to 129.8 feet. Extremely to moderately fractured.										
130	NM	C-10	129.3 - 131.8	30/30					C-10A (129.3 to 130.4'): Very soft to soft, black, very fine grained, COAL, with thin to very thin horizontal partings. Vertical cracks with calcite mineralization from 129.2 to 129.8 feet and 130.0 to 130.3 feet. Extremely to moderately fractured. REC=100%. RQD=37%.										
132	NM	C-11	131.8 - 133.8	24/20					C-10B (130.4 to 131.8'): Very soft to medium hard, dark gray, very fine grained, SILTY CLAY SHALE, with very thin to thin horizontal partings. Clay rich zone from 130.4 to 130.8 feet. Slight Organic sheen. Extremely fractured. C-11 (131.8 to 133.8'): Very soft to medium hard, dark gray, very fine grained, SILTY CLAY SHALE, with very thin horizontal bedding, slight Organic sheen. Extremely to moderately fractured. REC=83%. RQD=0%.										
134									Boring terminated at 133.8 feet. No refusal encountered.										
136									<b>NOTES:</b> 1. Approximately 5200 gallons of potable water was introduced during drilling upon completion of coring (approximately 3,200 gallons was used to advance to top of bedrock from a combination of potable wells and the plant fire suppression system; approximately 2,000 gallons of water from the plant fire suppression system was used during bedrock coring). 2. Continuous sampling started approximately 5 ft above the water table based on a water level measurement collected by Sanborn Head on 6/18/2018 at 15:20 at MW-1605S of 44.84 ft below Top of PVC Riser and at 15:34 at MW-1604S of 51.99 ft below Top of PVC Riser. 3. Advanced HWT casing to 29 ft bgs. Due to damage to casing advancer at 29 ft, advanced 3 1/4" ID hollow stem augers to 30 ft bgs to auger refusal at 84.7 ft bgs. Advanced HWT casing with roller bit advancer to 84.7 ft and began PWL coring at 84.7 ft. 4. Approximately 1 week following completion of sample collection, the borehole was completed as a monitoring well by Terracon Consultants, Inc. Monitoring well installation was not observed by Sanborn Head personnel.

## **CONDITIONS AND QUALIFICATIONS**

*Mineralogy, Inc. will endeavor to provide accurate and reliable laboratory measurements of the samples provided by the client. The results of any x-ray diffraction, petrographic or core analysis test are necessarily influenced by the condition and selection of the samples to be analyzed. It should be recognized that geological samples are commonly heterogeneous and lack uniform properties. Mineralogical, geochemical and/or petrographic data obtained for a specific sample provides compositional data pertinent to that specific sampling location. Such "site-specific data" may fail to provide adequate characterization of the range of compositional variability possible within a given project area, thus the "projection" of these laboratory findings and values to adjoining, "untested" areas of the formation or project area is inherently risky, and exceeds the scope of the laboratory work request. Hence, Mineralogy, Inc. shall not assume any liability risk or responsibility for any loss or potential failure associated with the application of "site or sample-specific laboratory data" to "untested" areas of the formation or project area. Unless otherwise directed, the samples selected for analysis will be chosen to reflect a visually representative portion of the bulk sample submitted for analysis. Where provided, the interpretation of x-ray diffraction, petrographic or core analysis results constitutes the best geological judgment of Mineralogy, Inc., and is subject to the sampling limitations described above, and the detection limits inherent to semi-quantitative and/or qualitative mineralogical and microscopic analysis. Mineralogy, Inc. assumes no responsibility nor offers any guarantee of the productivity, suitability or performance of any oil or gas well, hydrocarbon recovery process, dimension stone, and/or ore material based upon the data or conclusions presented in this report.*

*This report is to only be replicated in its entirety.*

**Sample Retention:** Samples will be stored for a period of 30 days and thereafter discarded. If additional sample storage time and/or return shipping is required, appropriate charges will be billed to the client.

**Geosyntec Consultants**  
Mountaineer | New Haven, WV

**MW-1805-122**  
MI#23009-01 - SEM

**Summary:** This core sample is characterized as a medium gray (N5), compact parallel-bedded, non-porous, micaceous, silty shale. The shale mineralogy is dominated by clay minerals and mica which together account for ~68% of the sample mass. The clay mineral suite is enriched with respect to illite/mica (~39%), chlorite (~16%), and kaolinite (~11%), coupled with relatively minor amounts of mixed-layered illite/smectite (~2%). The detrital silt and sand grains are moderately to poorly sorted, sub-rounded, and matrix-supported. The detrital grain assemblage includes quartz (~24%) plagioclase feldspar (~5%) and minor amounts of k-feldspar (~1%). Minor amounts of siderite (~2%) are also present in the silty shale. SEM Figures 1A through 1C provide backscatter & scanning electron views of a typical bedding plane surface. Traces of microporosity are locally present flanking the silt and sand grains. Figures 1D through 1F provide images of the shale fabric in cross section. The SEM images reveal the presence of scattered, lens-shaped macropores & micropores, preserved and sheltered by the propping effect of randomly distributed silt and sand grains.

**MW-1805-124.5**  
MI#23009-02 - SEM

**Summary:** This core interval is comprised of light gray (N8), cross-bedded, medium-grained, well sorted, quartz-cemented, sub-arkosic sandstone. The sandstone fabric is well-cemented & moderately porous, with scattered intergranular macropores. Pore-filling authigenic kaolinite clay is scattered throughout the sandstone framework, occurring as vermicular stacks of clay platelets (see Figures 2E & 2F). The quartz-rich framework is well-cemented with authigenic quartz overgrowths. Total macroporosity for this sandstone is estimated to comprise ~ 6-9% of the sandstone bulk volume. The mineralogy of the sandstone is dominated by quartz (73%), feldspar [including plagioclase (7%) and k-feldspar (8%)], kaolinite (7.5%), illite / mica (4%), and scattered traces (i.e., <0.5%) of siderite, calcite, and pyrite.

**MW-1805-128**  
MI#23009-03 - SEM

**Summary:** A compact, parallel bedded seam of coal is present at core depth 128'. Based on the x-ray diffraction pattern collected for this material, the organic matter is estimated to exhibit a maximum rank of medium to low volatile bituminous coal. The mineralogical analysis indicates that thermally altered organic matter (coal) comprises ~84% of the sample mass. The inorganic mineral fraction includes a mixture of clay matrix minerals (~8%), quartz (~4%), and pyrite (~4%). The clay mineral fraction is comprised of kaolinite coupled with minor amounts of illite & mixed-layered illite/smectite. The pyrite & clay minerals are typically present as authigenic minerals that have crystallized within fractures and dissolution voids contained within the coal.

**MW-1805-130.5**  
MI#23009-04 - SEM

**Summary:** This core interval is comprised of medium light gray (N6), compact, parallel-bedded, non-porous, micaceous, silty shale / clay-rich siltstone. The silt-rich grain fraction is sub-arkosic, moderately sorted, and sub-rounded to sub-angular. The relative proportion of silt & clay matrix / mica is variable between individual bedding layers, with some interbeds characterized as clay-rich (grain-supported) siltstones. Minute mica laths are abundant throughout the sedimentary fabric. Based on the XRD mineralogical analysis, clay minerals account for ~ 58% of the mineral mass. The clay mineral suite includes illite / mica (~33%), chlorite (~14%), kaolinite (~10%), and mixed-layered illite/smectite (~1%). Silt grain materials are dominated by quartz (~32%) and feldspar [including plagioclase (~7%) and k-feldspar (~1%)]. Minor amounts of siderite cement (~1.5%) and pyrite (~0.5%) are also present, distributed as minute (~1-5 um diameter) crystals dispersed throughout the clay-rich groundmass. Total void space is estimated to account for <2% of the bulk volume. The sedimentary fabric includes small amounts of residual macroporosity & microporosity. The sheltered interparticle voids are locally preserved as minute, lens-shaped voids that appear isolated due to the pervasive distributions of detrital clay matrix.

MI#23009-05 - SEM

**Summary:** This core sample is characterized as a cross-bedded, medium-grained, well-sorted, quartz-cemented, moderately porous, sub-arkosic sandstone. The framework is compact and exhibits common point-to-point & elongated intergranular contacts. Rims of syntaxial quartz overgrowth cement are locally intergrown along contacts shared by adjoining quartz grains. Scattered feldspar grains exhibit indications of intra-particle corrosion and localized replacement with authigenic kaolinite. The mineralogy of the sandstone is comprised of quartz (~86%), plagioclase feldspar (~4%), k-feldspar (~1%), kaolinite (~6%), illite / mica (~2.5%), and traces of calcite (0.5%), and mixed-layered illite/smectite (<0.5%) [see Table I]. Macroporosity is visually estimated to comprise ~ 8-10% of the sandstone bulk volume.

MI#23009-06 - SEM

**Summary:** This core sample is similar to the core interval @ 104.5' (MI#23009-05) & is characterized as a cross-bedded, medium-grained, moderately-sorted, quartz-cemented, moderately porous, sub-arkosic sandstone. The framework is compact and exhibits common point-to-point & elongated intergranular contacts. Rims of syntaxial quartz overgrowth cement are locally inter grown along contacts shared by adjoining quartz grains. Scattered feldspar grains exhibit indications of intra-particle corrosion and localized replacement with authigenic kaolinite. The mineralogy of the sandstone is comprised of quartz (~85%), plagioclase feldspar (~3%), k-feldspar (~2%), kaolinite (~6%), illite / mica (~3%), and traces of goethite (0.5%), hematite (~0.5%) and chlorite (<0.5%) [seeTable I]. Macroporosity is visually estimated to comprise ~ 5-7% of the sandstone bulk volume.

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Allison Kreinberg  
Geosyntec Consultants Inc  
500 West Wilson Bridge Road  
Suite 250  
Worthington, Ohio 43085

Generated 4/18/2023 12:16:08 PM

## JOB DESCRIPTION

MTR BAP

## JOB NUMBER

240-183413-1

# Eurofins Canton

## Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

## Authorization

Job ID: 240-183413-1

## Qualifiers

### Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Case Narrative

Client: Geosyntec Consultants Inc  
Project/Site: MTR BAP

Job ID: 240-183413-1

**Job ID: 240-183413-1**

**Laboratory: Eurofins Canton**

## Narrative

**Job Narrative  
240-183413-1**

## Comments

Run Total Metals - no leaching - per client email request.

## Receipt

The samples were received on 4/12/2023 9:45 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.6° C.

## Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Organic Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Method Summary

Client: Geosyntec Consultants Inc  
Project/Site: MTR BAP

Job ID: 240-183413-1

Method	Method Description	Protocol	Laboratory
6020B	Metals (ICP/MS)	SW846	EET CAN
3050B	Preparation, Metals	SW846	EET CAN
Part Size Red	Particle Size Reduction Preparation	None	EET CAN

**Protocol References:**

None = None

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

**Laboratory References:**

EET CAN = Eurofins Canton, 180 S. Van Buren Avenue, Barberton, OH 44203, TEL (330)497-9396

240-183413 Chain of Custody

Preservation Used: 1=Ice; 2=HCl; 3=H2SO4; 4=HNO3; 5=NaOH; 6=Other

Possible Hazard Identification:

Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments section if the lab is to dispose of the sample.

### Certification by a Qualified Professional Engineer

## CERTIFICATION BY A QUALIFIED PROFESSIONAL ENGINEER

I certify that this alternative source demonstration is appropriate for evaluating the groundwater monitoring data for the Mountaineer BAPs CCR management unit and that the requirements of 40 CFR 257.95(g)(3)(ii) have been met.

## **Appendix 4**

The notice of initiating the assessment monitoring program and subsequently the Assessment of Corrective Measures program follow.

Mountaineer Plant

Notice of Assessment Monitoring Program Establishment

Bottom Ash Pond

On January 15, 2018, it was determined that Mountaineer Plant's Bottom Ash Pond had statistically significant increases over background for Boron, Calcium, Chloride, Fluoride, Sulfate, and Total Dissolved Solids (TDS). An alternative source demonstration was not successful within the 90 day period as allowed for in 257.94(e)(2) prompting the initiation of an assessment monitoring program, which was established on April 13, 2018. Therefore this notice is being placed in the operating record in accordance with the requirement of 257.94(e)(3).

**Mountaineer Plant**

**Notice for Initiating an Assessment of Corrective Measures**

**CCR Unit – Bottom Ash Pond**

This notice is being provided, as required by 40 CFR 257.95(g)(5), that an Assessment of Corrective Measures was initiated on March 26, 2019 for Mountaineer Plant's Bottom Ash Pond due to the statistically significant concentrations detected above the established groundwater protection standard for lithium.

## **Appendix 5**

No monitoring wells were installed or decommissioned during  
this reporting period.
